Additional Details

Post- Fire Flooding

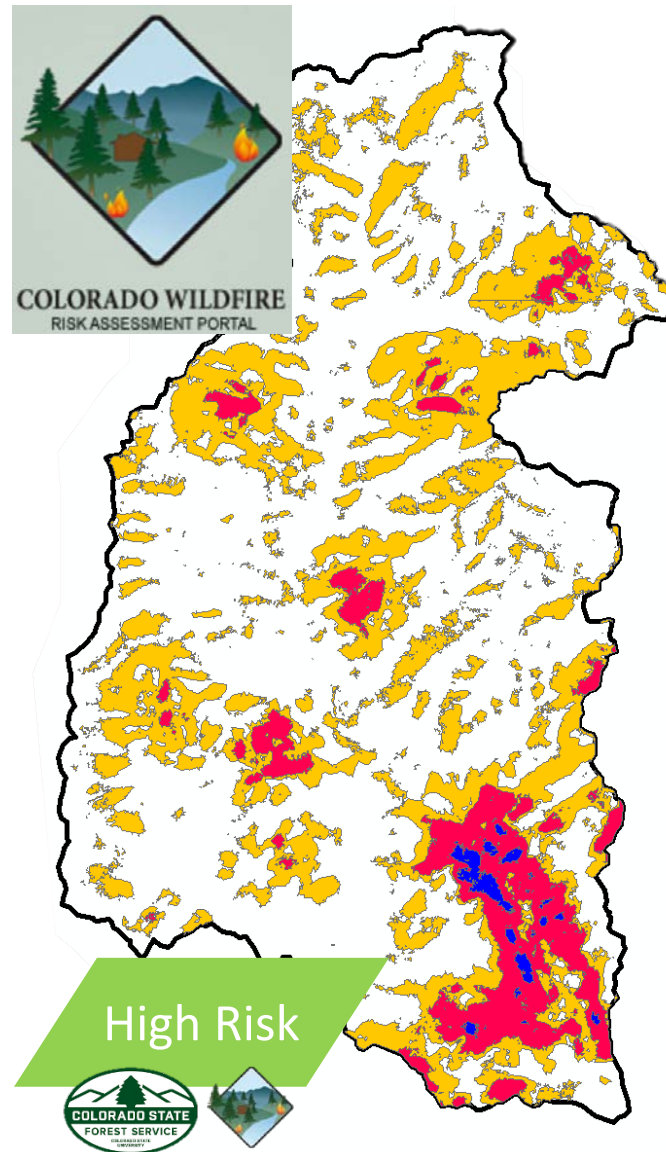

Hermosa Creek and Junction
Creek

Fire and Flood Risk

- La Plata County and City of Durango requested post fire flooding analysis to increase resilience.
 - **Junction Creek Watershed** – heavily forested with significant development at downstream end
 - **Hermosa Creek Watershed** - added after 416 Fire
- 416 Fire
 - June 1 – July 31, 2018
 - 57,000 Acres (largely in Hermosa)
- Wildfire risk may become increasingly important as beetle kill continues to move from the south.

Scenarios

Base - Hydrology

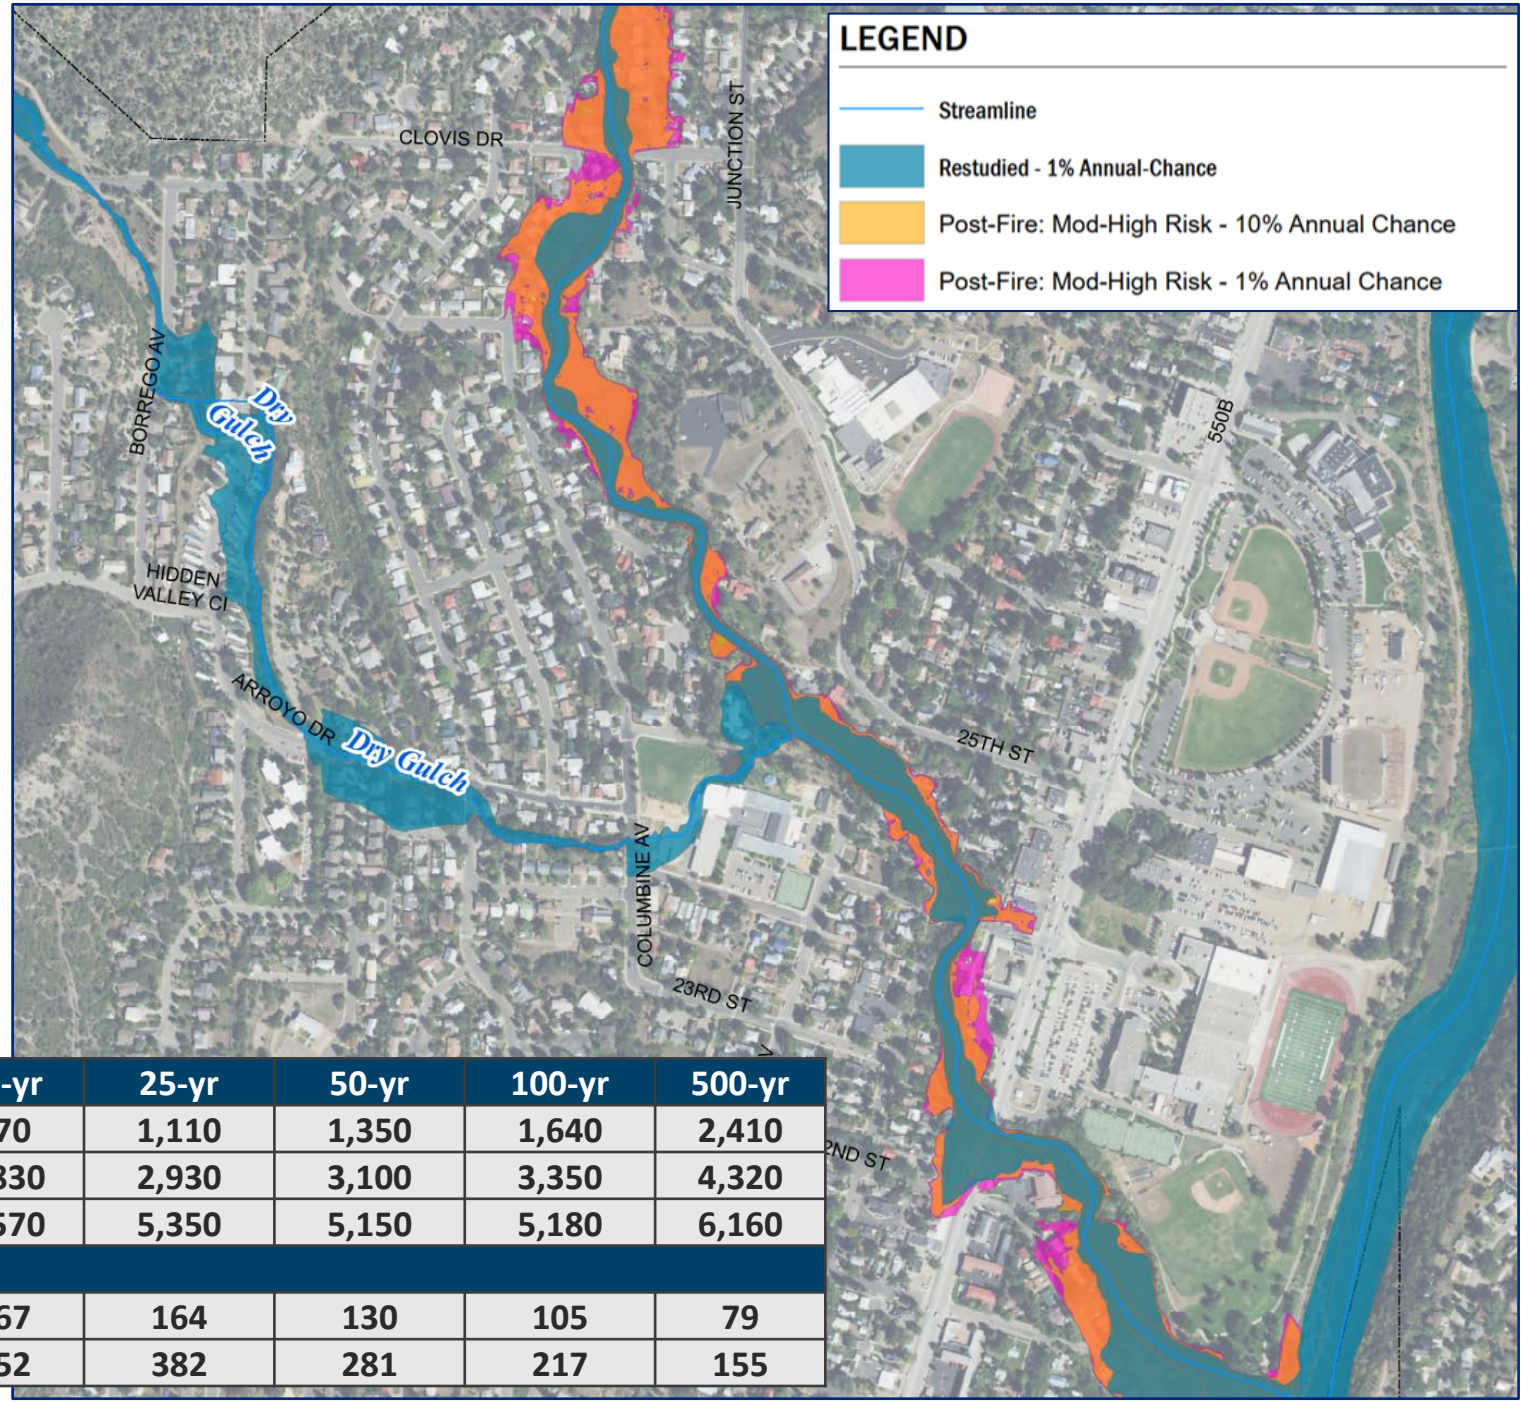

- Gage analysis results from Risk MAP
 - USGS Gage Hermosa Creek Near Hermosa, CO
- Existing conditions HEC-HMS model setup to match gage
 - CN Calibration

Post-Fire Hydrology

- Post-fire CN adjustments
 - Spatial identification of fire footprint
 - CN modification based on USDA examples. Factors:
 - Burn severity
 - Initial landcover type
 - Pre-burn soil condition
 - New basin composite CN values
- Sediment bulking factor applied based on empirical estimates (1.09 – 1.12)
 - Bulking factor of 1.25 transitions to debris flow

Hydraulics and Mapping

- Hermosa and Junction Creek Models
- Minor revisions to the ineffective flows as necessary
- 10 year and 100 year outputs
 - Minimal extents, larger changes in depth.

Ice Jamming

Animas River & Cement
Creek

Ice Jamming Background

- The Town of Silverton noted ice jamming as a historic issue.
- Also documented by the US Army Corps of Engineers CRREL ice jam database.

Method

1. Separate gage records into snowmelt only events– FFA using 17C
2. Determine average ice thickness (t_i) based on:
 1. Temperature record
 2. Accumulated Freezing Degree Days calculation (AFDD)
 3. Stefan Equation (C – coefficient)

$$t_i = C(AFDD)^{0.5}$$
3. Determine ice forming flow and run in HEC-RAS to estimate ice cover thickness and width

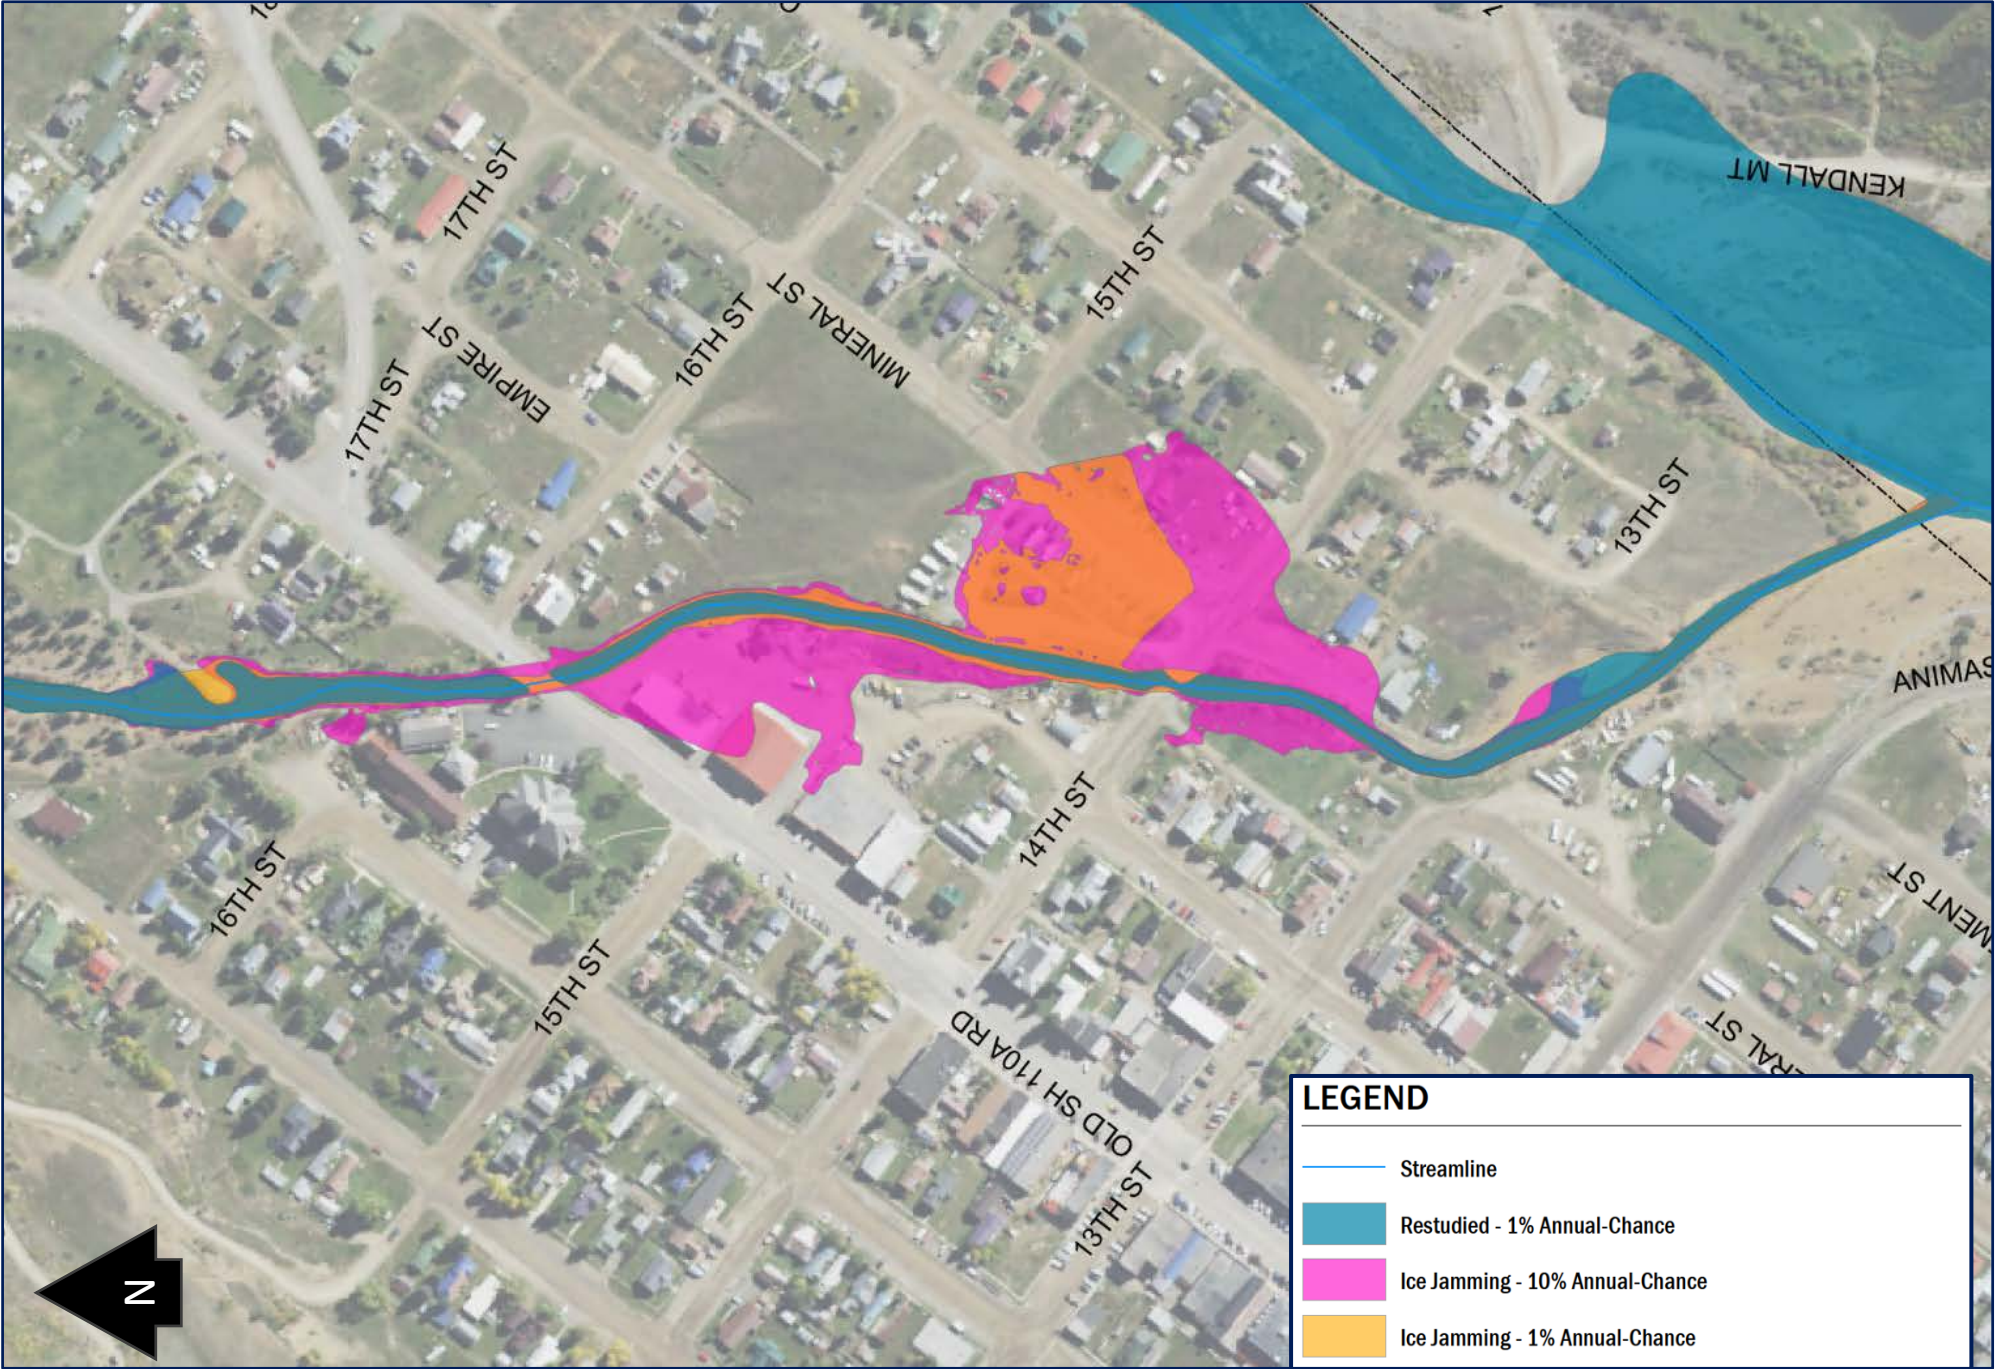

Method (cont'd)

4. Identify locations where jamming is possible
 5. Set jam parameters and possible jam locations – run HEC-RAS to identify ice effected WSELs
- Combined probability analysis using open-water vs. snowmelt WSEL results can be used to generate updated profiles
 - For non-regulatory products, only looked at mapping

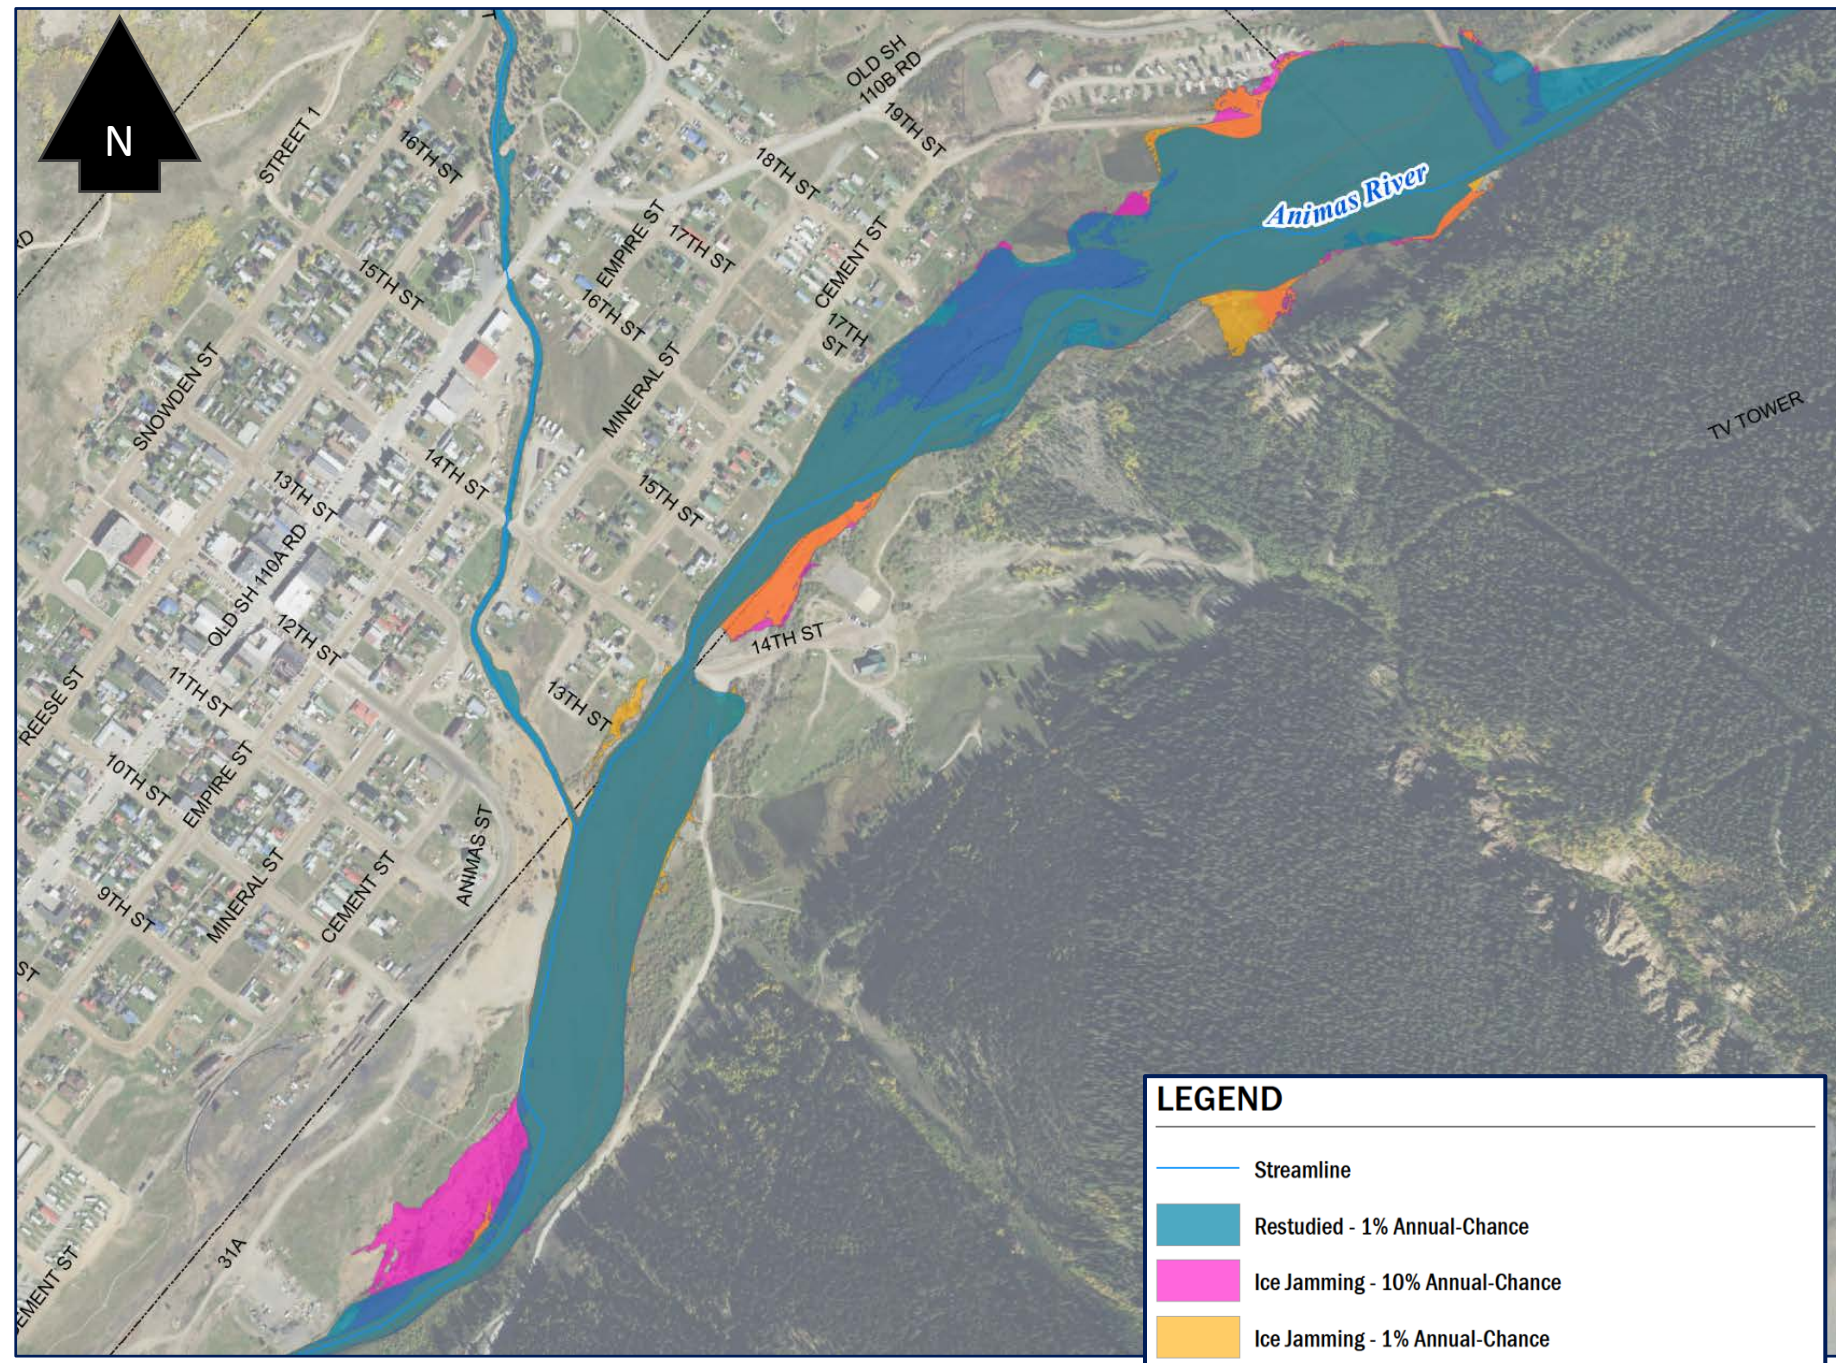

Cement Creek

Animas River

- No WSEL calibration data available
- Hypothetical jam scenarios
- Conservative results

Snowmelt

Hermosa Basin &
Silverton

Near-future Snowmelt Forecast

© MARK ANDERSON

WWW.ANDERSTOONS.COM

"And now the 7-day forecast..."

SNODAS

Flood Annual Chance

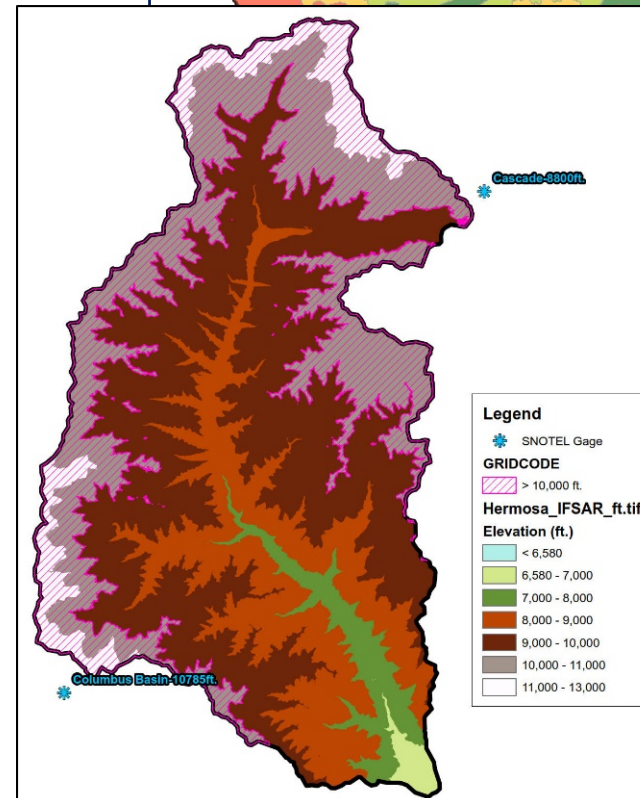

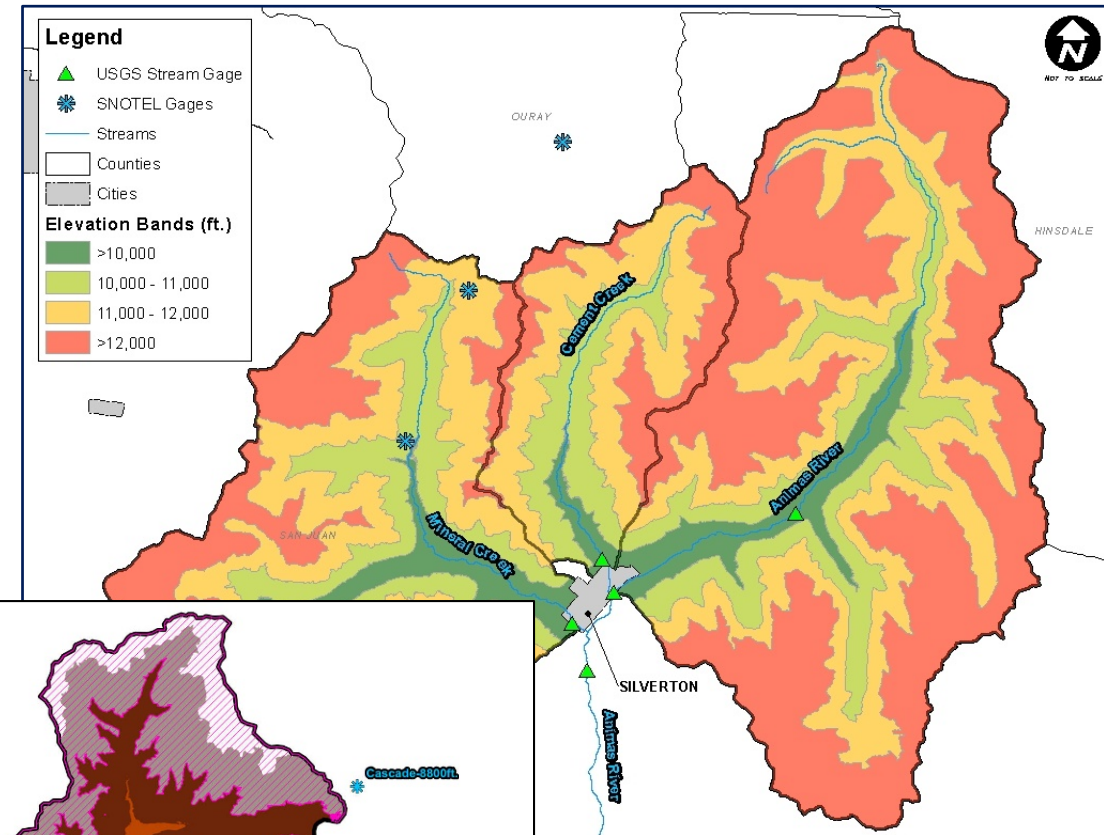

NOAA Atlas

Overview

- 2019 high snowpack year
- Data available for early warning on potential snowmelt flooding
- Project areas
 - Hermosa
 - Silverton
- On June 15, 2019:
 - Mineral Creek basin:
 - Red Mountain Pass SNOTEL gage:— 17.7 in. SWE (970% of 1981-2010 average)
 - Hermosa Creek basin:
 - Columbus Basin SNOTEL gage: 25.7 in. SWE (1,078% of 1981-2010 average)

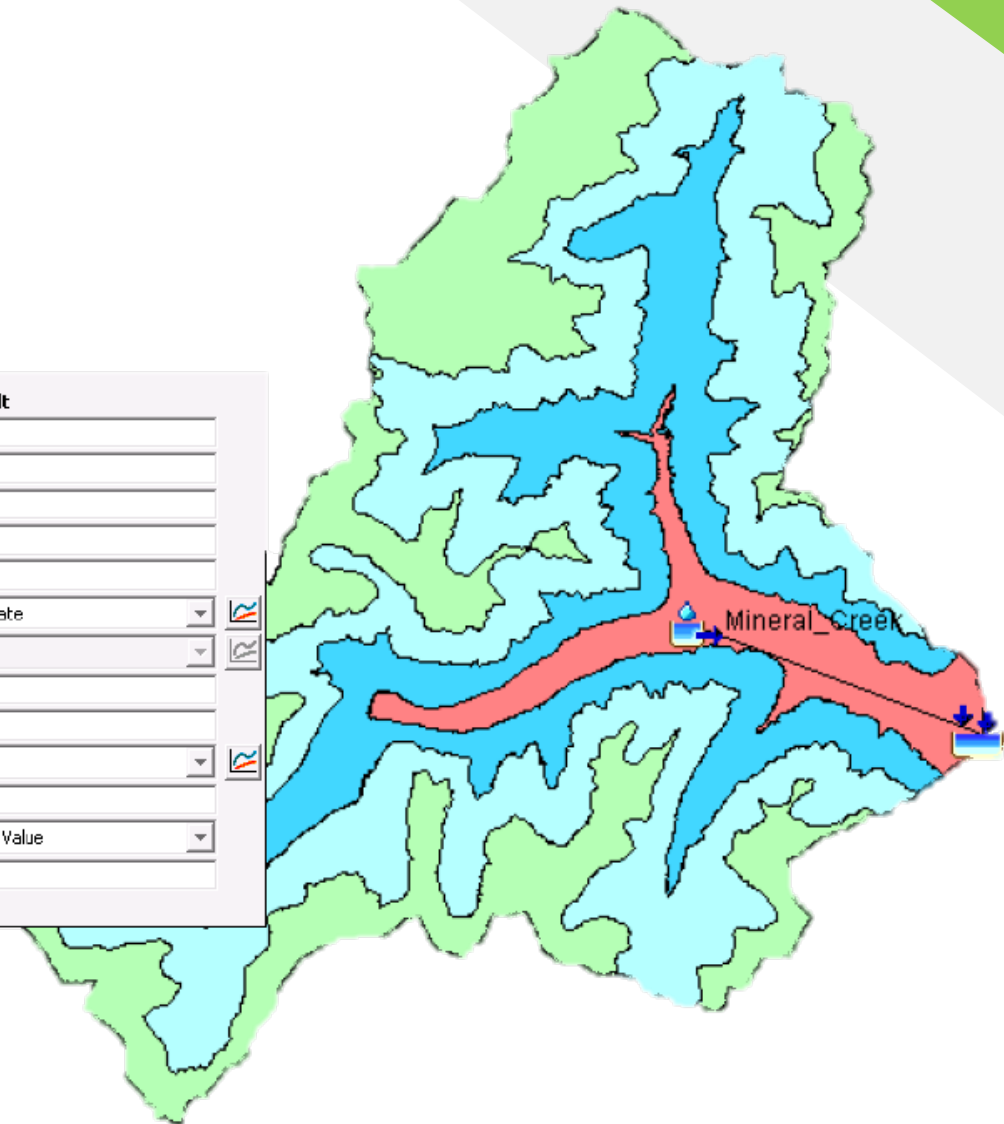

Methods – Similarities

- Accumulated Fahrenheit Degree Day (AFDD)
Methodology - Temperature Index Modeling in HEC-HMS
- Simple basin schematic
- Only modeled snowpack decay – assumed no snow or rain events
- Calibrated and validated HEC-HMS model using historical records

Met Name: Snowmelt

*PX Temperature (F)	33
*Base Temperature (F)	32
*Wet Meltrate (IN/DEG F-DAY)	0.129921
Rain Rate Limit (IN/DAY)	0
ATI-Meltrate Coefficient:	0.98
*ATI-Meltrate Function:	Dry Meltrate
Meltrate Pattern:	--None--
Cold Limit (IN/DAY)	0
ATI-Coldrate Coefficient:	0.035
ATI-Coldrate Function:	Coldrate
Water Capacity (%)	3
Groundmelt Method:	Constant Value
Groundmelt (IN/DAY)	0

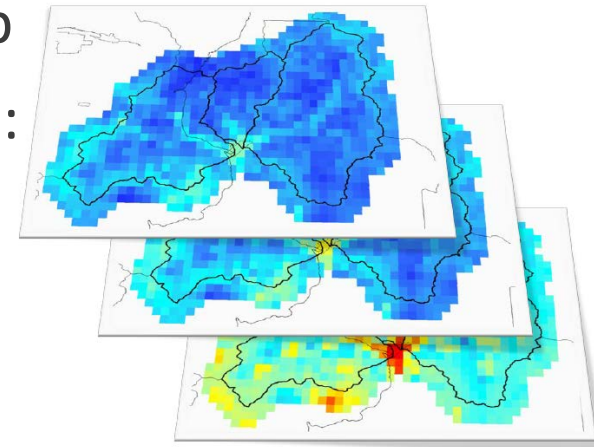

Methods – Differences

Hermosa

- SNOTEL data – assumed depth and area of snow coverage
2 gages (10.8k vs 8.8k ftmsl)
- 24-hr model time-step
- No overlap between stream gage and snowpack record – calibration only based on snowpack

Silverton

- SNODAS data – modeled forecast of SWE from National Snow & Ice Data Center
(no SNOTEL gage)
- 6-hr model time step
- Models calibrated to:
 - snowpack
 - streamflow

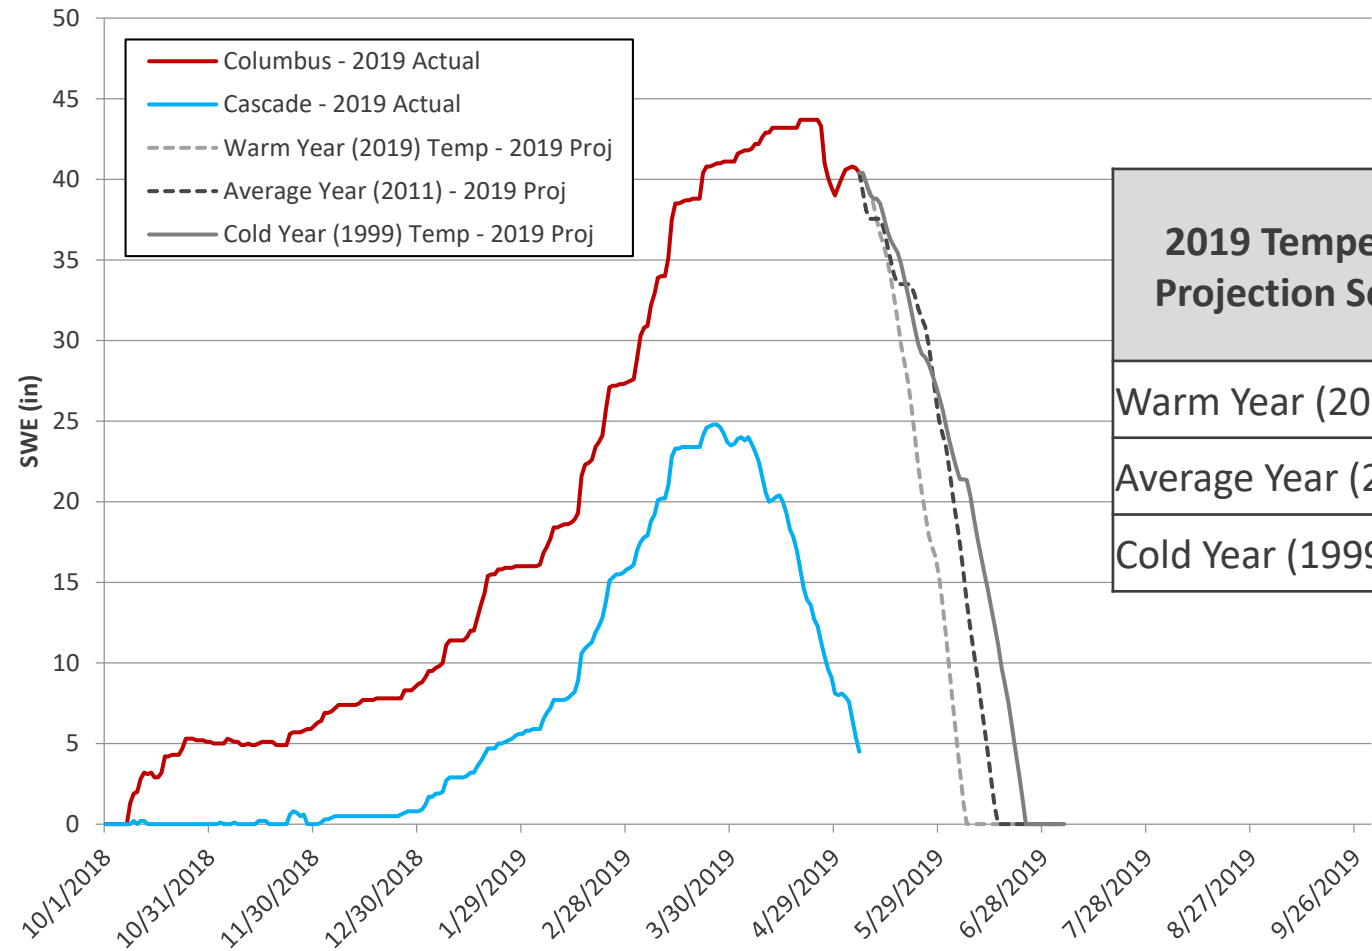

2019 Predictions & Outreach

- Assumed peak snowpack
- Evaluated 3 temperature scenarios including:
 - Warm Year (Actual)
 - Average Year (Actual)
 - Cold Year (Actual)
- Generated predictions in spring – outreach with communities
 - Shared predicted range of flows
 - Shared draft floodplains for corresponding recurrence intervals

Outreach Sample

Timing & Rates

2019 Temperature Projection Scenario	Q Peak (cfs)	Peak Date	*Estimated Recurrence Interval
Warm Year (2012)	3,250	6/3/2019	25-50 Year
Average Year (2011)	2,730	6/7/2019	10-25 Year
Cold Year (1999)	2,390	6/24/2019	10-25 Year

Results: Hermosa

— Columbus: 2019 Actual (Post-Prediction)

Accumulated Fahrenheit Degree Day (AFDD)

Melt-rate similar to average/warm temperature scenarios

Late season accumulation

Results: Mineral Creek (SWE)

Results: Mineral Creek (Q)

2019 Scenario	Q Peak (cfs)	Peak Date	Recurrence Interval
Warm Year (2018)	1,520	6/24/2019	~ 25 Year
Average Year (1999)	1,340	6/29/2019	~ 10 Year
Cold Year (1993)	1,270	7/1/2019	< 10 Year
2019 Actual	1,020	6/29/2019	< 10 Year

Main Points

Temperature driven, means elevation-band based

Peak flow is based on slope (melt rate) not snowpack

**Larger snowpack = later melt/
season = larger rate**

Travel Time Estimator

Purpose

- Gold King spill
- Use model depth and velocity grids to estimate travel times from any point in the watershed
- Early warning system
- $T=d/v$
- Webtool that can toggle varied flows and locations

How Do We Innovate?

Q: How can we portray flood risk to raise awareness of pre-disaster hazard mitigation and enhance public safety in a compelling way?

Telling A Compelling Story

"We came to the shallow, yellow, muddy South Platte, with its low banks and its scattering of flat sand-bars and pigmy islands — a melancholy stream straggling through the centre of the enormous flat plain, and only saved from being impossible to find with the naked eye by its sentinel rank of scattering trees standing on either bank"

-Mark Twain
Roughing It

- Delegated Approval & Pre-authorized for Construction

CAP Project on Lower Boulder Creek

Specifically Authorized

Longer-term → Requires Authorization

- Feasibility Study & Integrated NEPA
- Upon Approval Construction Authorized through WRDA

Streamlined Construction (CAP)

Pre-Authorized for Construction within Limits

Planning Phase

- Feasibility Study – 50 / 50 above \$100K
- Delegated approval authority (NWD Commander)

Construction Phase

- Cost-share based on project type & program

Section	Authority	Purpose	Cost share % (Fed/non-Fed)	Federal Project limit	Program limit (competitive funds)
14	Emergency Streambank Protection	Small erosion risk reduction projects for public infrastructure and facilities	65/35	\$5,000,000	\$25,000,000 per FY
205	Flood Damage Protection	Small flood risk management projects	65/35	\$10,000,000	\$68,750,000 per FY
206	Aquatic Ecosystem Restoration	Restore degraded aquatic ecosystem in the public interest	65/35	\$10,000,000	\$62,500,000 per FY
1135	Modifications for Improvement of the Environment	Restore a degraded ecosystem that resulted from historic Corps projects	75/25	\$10,000,000	\$50,000,000 per FY
203	Tribal Partnership Program	Protect Tribal property and cultural resources, restore natural habitats	65/35	\$12,500,000	n/a ²¹

CAP Projects in Colorado

Section 205 – Flood Risk Management

- St Vrain Creek, Longmont, CO
 - Feasibility Study scheduled to be complete in early 2020

Section 1135 – Ecosystem Restoration in Corps Project Areas

- South Platte River, Denver, CO (middle)
 - Design anticipated to start later this year

Section 206 – Ecosystem Restoration

- Lower Boulder Creek (left)
 - Construction Scheduled to be done by early 2020.
- Cache la Poudre River, Greeley, CO (right)
 - First phase of construction scheduled to be complete in 2020

Specifically Authorized

Congressionally Directed

Authorized by Phase

Study authority typically a Committee Resolution

Construction authority typically through WRDA

Appropriations are individual line items

Energy and Water Appropriations Acts

Limited discretion through workplan (if applicable)

Limited number of “New Starts” annually

Scope is not constrained

No maximum project cost limit

Allows for multi-purpose projects/watersheds

Approval Authority resides with ASA(CW)

Upon approval report is provided to Congress for consideration for authorization for construction (WRDA)

South Platte River Multi-purpose GI Study (above)
& Bear Creek Water Reallocation Study (below)

Specifically Authorized Projects in Colorado

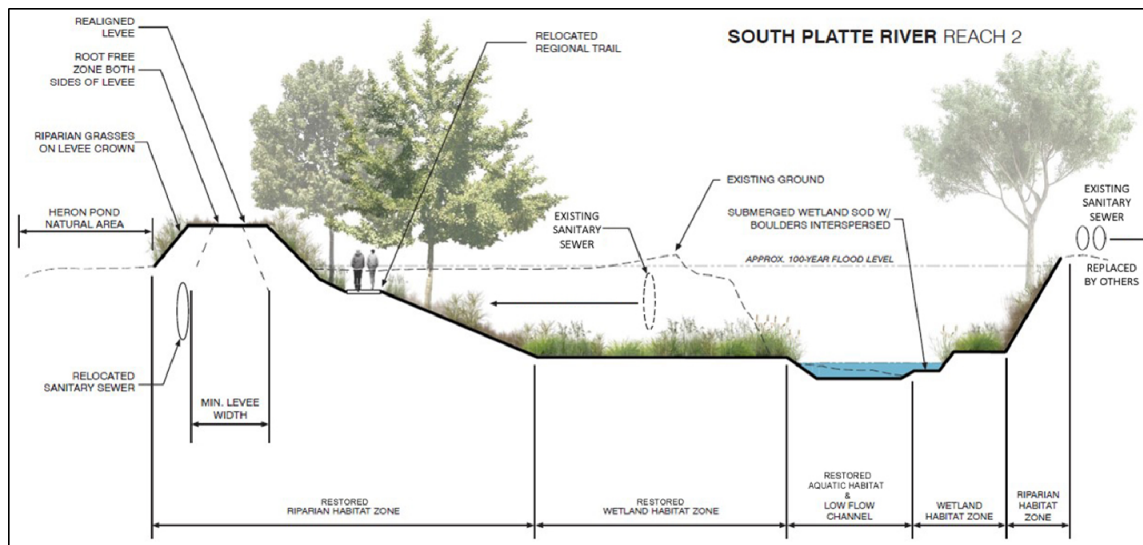

Chatfield Reallocation Project

- Project reallocating >20,000 acre-ft within the Chatfield Reservoir for Water Supply and Environmental Purposes.

Bear Creek Reallocation Project

- Project seeking to reallocate storage within the Bear Creek Reservoir for Water Supply
- Feasibility Study started in August 2019

Adams & Denver Counties, CO Project (left)

- Large scale (~\$520M) Ecosystem Restoration & Flood Risk Management Project in Denver, CO.
- Chief's Report signed in July 2019 to finalized Feasibility Study

Types of Flood Inundation Maps

■ Modeled Flood Inundation Map Libraries

- Probabilistic flows (i.e. 1% chance flood)
 - Most common examples are FEMA's Flood Insurance Rate Maps (FIRM)
 - Typically, several are created (20%, 10%, 4%, 1%, 0.2% Exceedance Probability Flows)
- Scenario based
 - Dam break
 - Levee breach
- Deterministic flows – USGS Flood Inundation Mapping Program
 - Stage Intervals
(i.e. every 2 feet in stage)
 - Critical stages
(i.e. Moderate and Major flood stages)

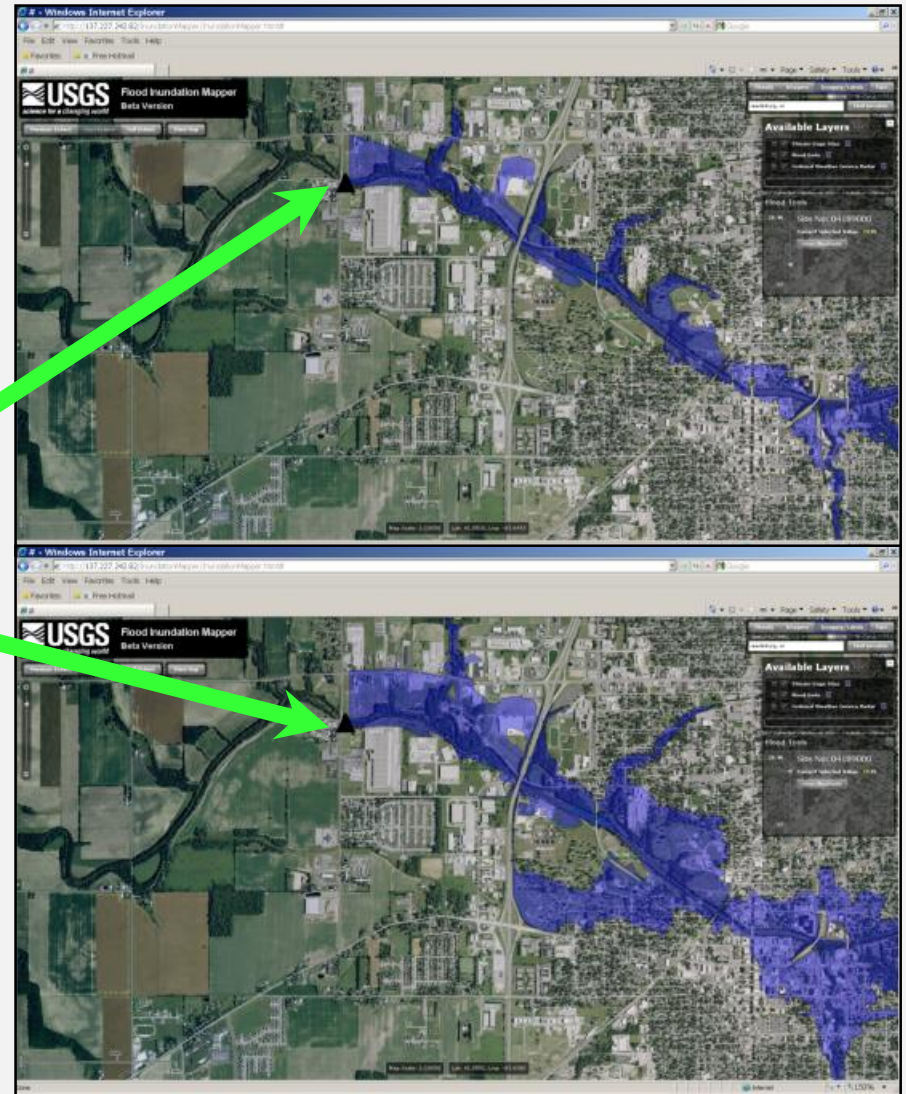

Deterministic Flood Inundation Map Libraries

- Based on even “slices” of stage or flow
- Any hydraulic model (calibrated to a USGS gage rating curve)
- Presents a full range of maps
 - Usually ~15 maps
 - From bankfull to peak of record
- Robust as long as base conditions don’t change

Flood inundation maps can translate a hydrograph into operational maps that communicate risk and consequences.

USGS and NWS Data Networks

Over 8,100 USGS Gages reporting current stream conditions in NWIS

Over 4,000 NWS Flood Forecast/Warning locations in AHPS

Surface Water Tech Memorandum 2015.03

USGS Flood-Inundation Map Development and Documentation Standards

- At a USGS gage
- Starts with NWS guidelines but with 10 exceptions/additions
- Documentation
- Peer-review

February 9, 2015

OFFICE OF SURFACE WATER TECHNICAL MEMORANDUM 2015.03

SUBJECT: USGS Flood-Inundation Map Development and Documentation Standards

Introduction and Purpose

The U.S. Geological Survey (USGS) is a leader in flood-inundation modeling and mapping. Flood-inundation maps (FIMs) show inundation extent, and in some cases inundation depth, for a wide range of streamflows and are distinguished from Federal Emergency

Surface Water Tech Memorandum 2015.04

- **USGS Furnished Flood-Inundation Map Policy**
- **First approved in Idaho, Dec, 2015**
- **At a USGS gage**
- **Meets USGS Requirements**
- **Work with local USGS Water Science Center**

United States Department of the Interior
U.S. GEOLOGICAL SURVEY
Reston, Virginia 20192

February 9, 2015

OFFICE OF SURFACE WATER TECHNICAL MEMORANDUM 2015.04

SUBJECT: USGS Furnished Flood-Inundation Map Policy

Introduction and Purpose

The U.S. Geological Survey (USGS) is partnering through the Integrated Water Research Science and Services (IWRSS) consortium with the National Weather Service and the U.S. Army

USGS FIM Program becomes a tool for flood...

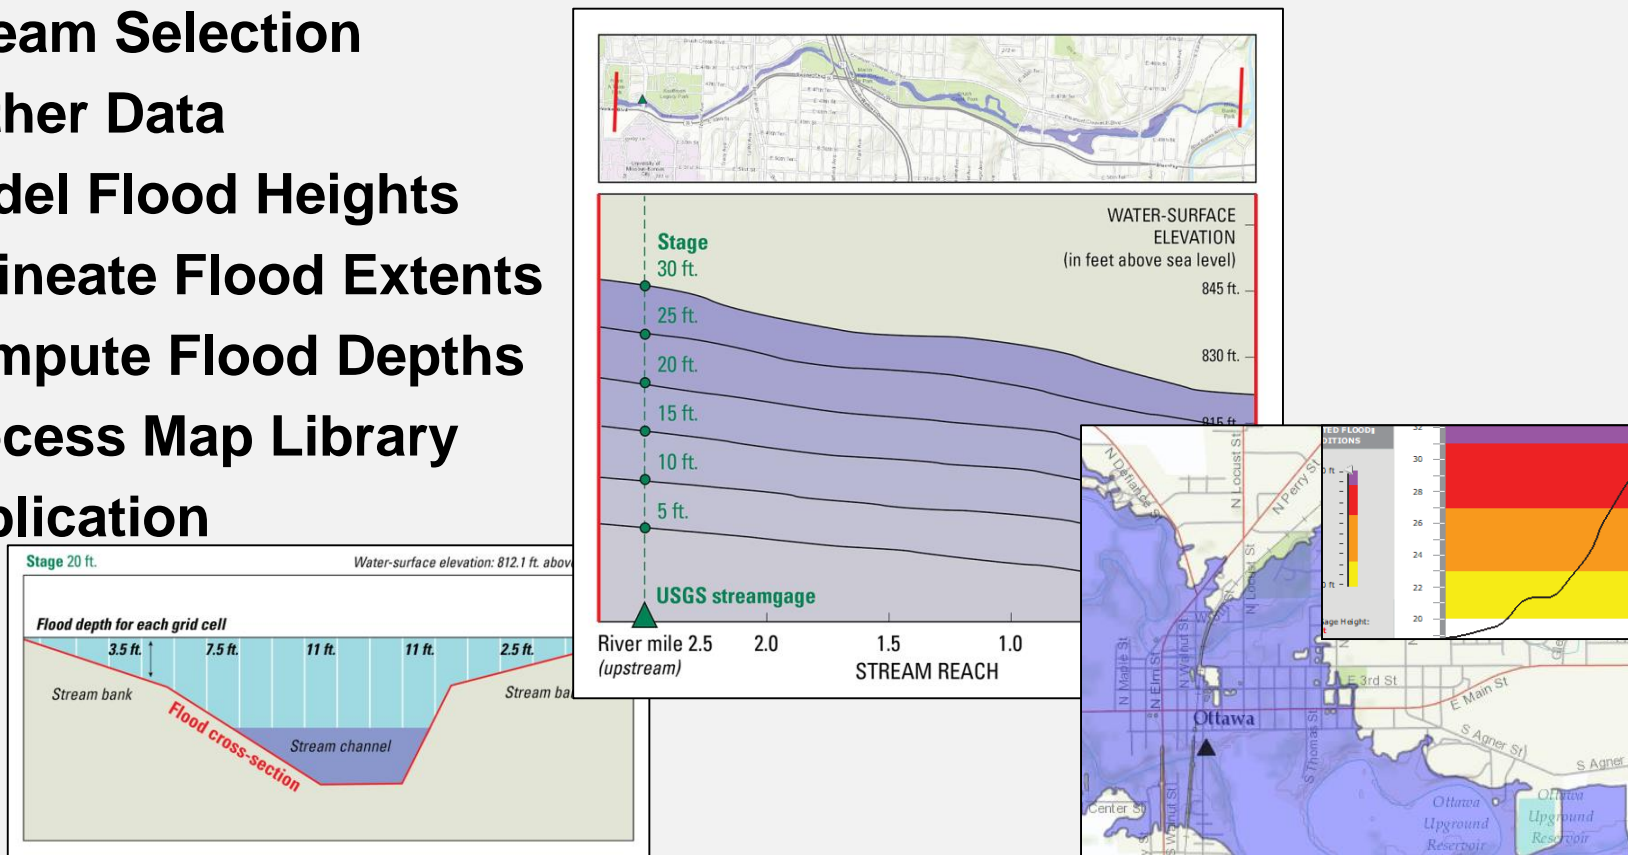

- Preparedness
 - “What-if” scenarios
- Response
 - Tied to gage & forecast data
- Recovery
 - Damage assessment

- Mitigation & planning
 - Flood risk analyses
- Environmental & ecological assessments

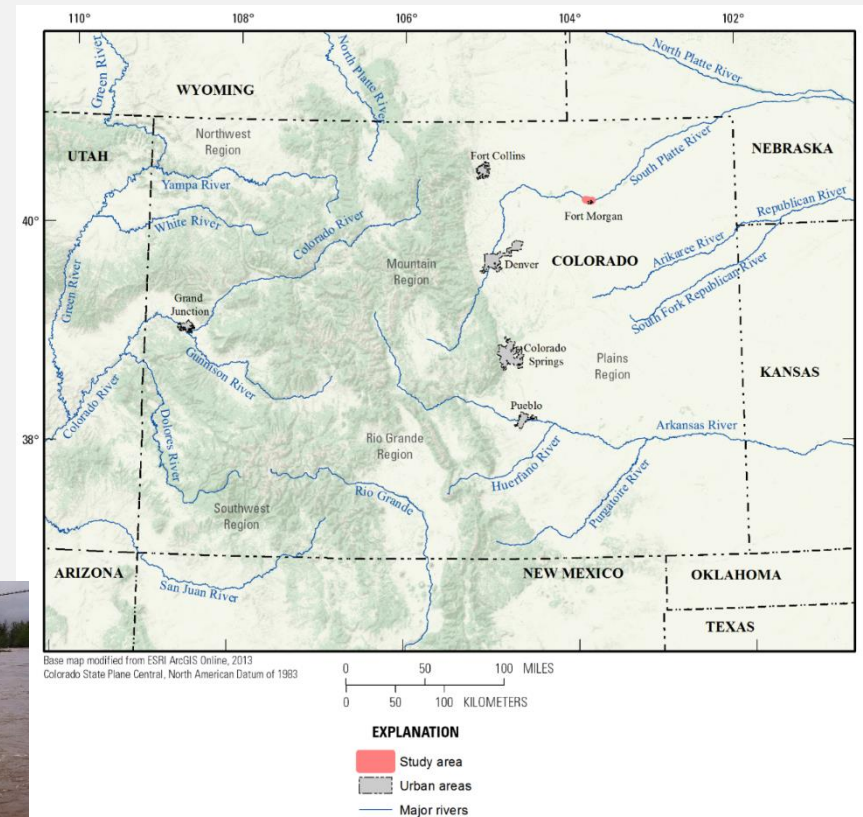

USGS Flood Inundation Map Libraries Workflow

1. Stream Selection
2. Gather Data
3. Model Flood Heights
4. Delineate Flood Extents
5. Compute Flood Depths
6. Process Map Library
7. Publication

1. Stream Selection

- Streamflow information
- Flood forecast information
- Elevation data availability
 - Topography
 - Bathymetry
 - Structural surveys
- Flood impact locations
 - Critical infrastructure
 - Populations

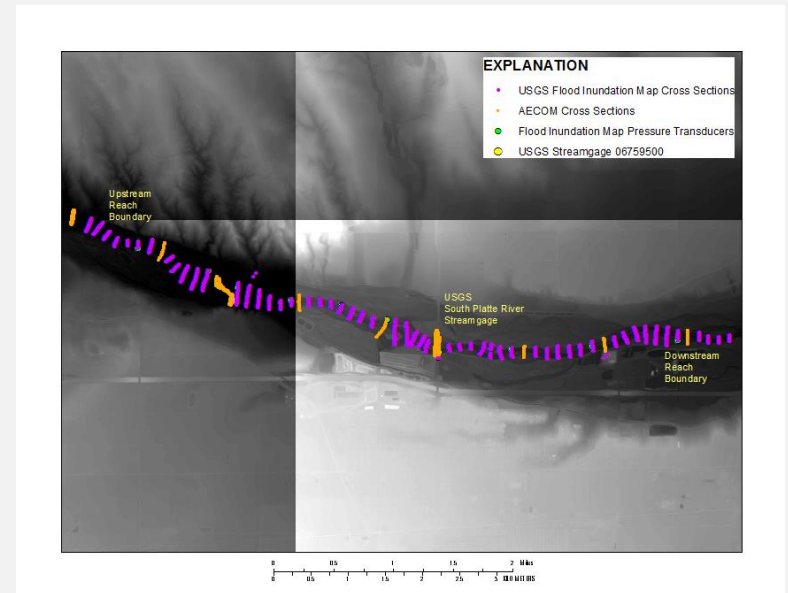

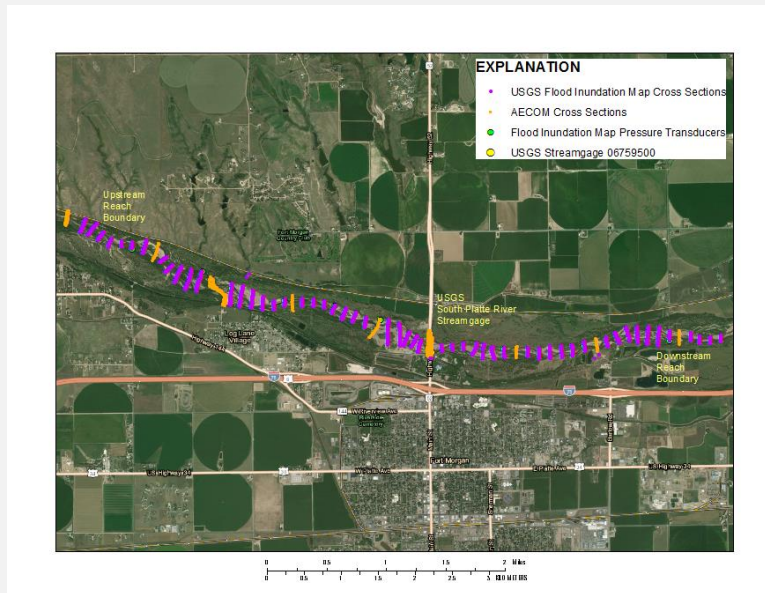

2. Gather Data

- Real-time streamflow information from a gage within the selected reach
 - Historical flood levels at that gage
 - Current and historical rating curves at that gage
 - Additional flood stage data within the reach

2. Gather Data

- High-resolution elevation data (dictates the quality of the maps more than any other factor)
- Existing hydraulic models (if available and recent)

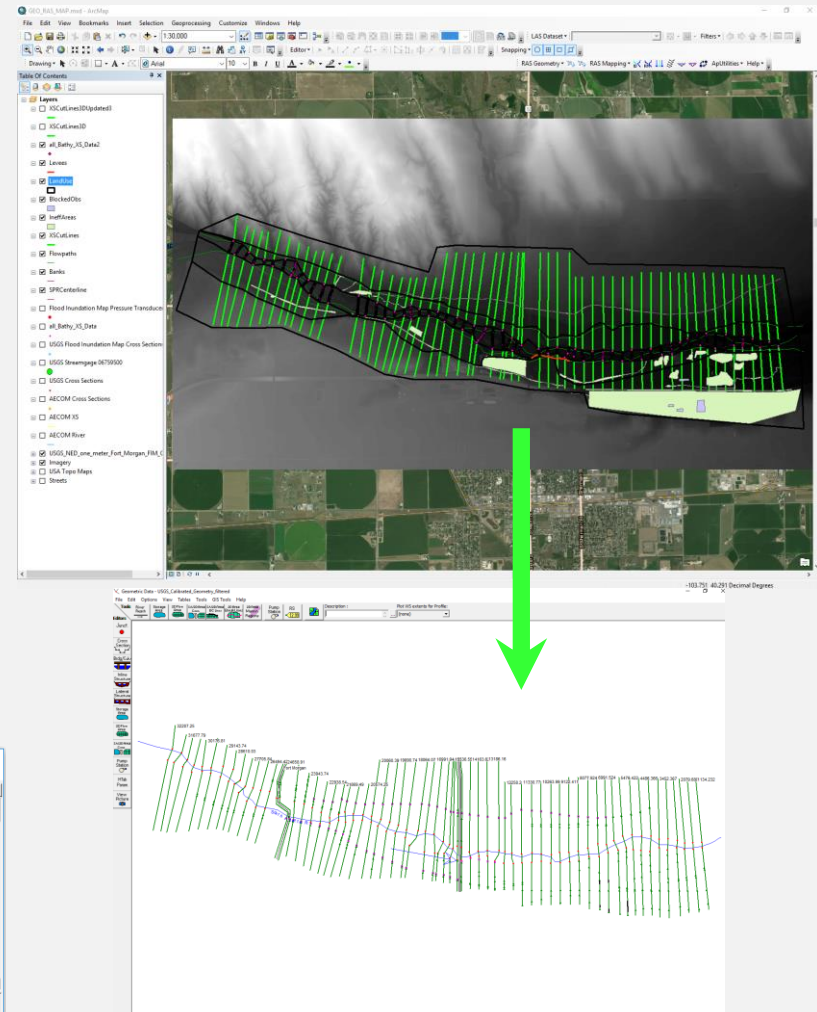

3. Model Flood Heights

Hydraulic Modeling

- Any appropriate model is accepted.
 - USACE HEC-RAS is common
 - Model must be peer-reviewed and documented.
- Calibrate model to streamgauge record and topography
 - Well-developed rating curves are crucial.

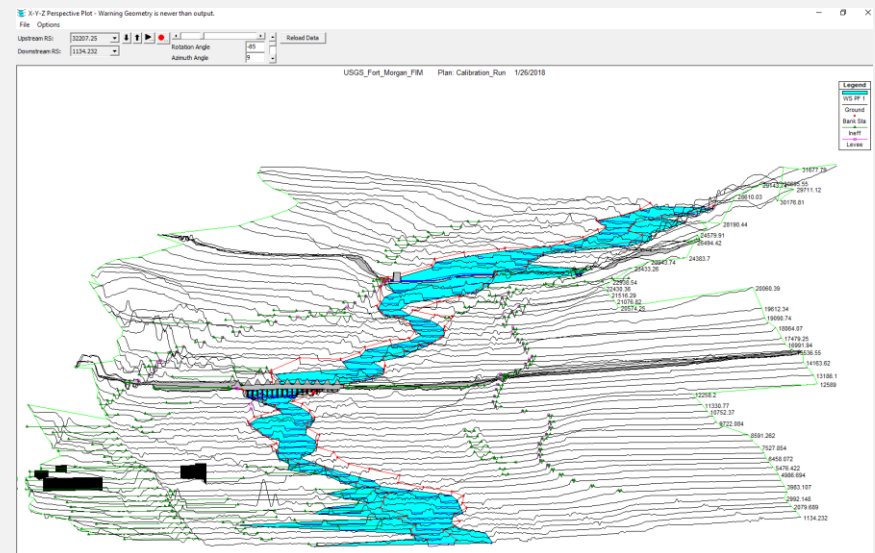

Profile Output Table - Standard Table 1														
HEC-RAS Plan: Plan 01 River: South Platte R. Reach: Fort Morgan Profile: PP 1

Total flow in cross section.														

3. Model Flood Heights

Hydraulic Modeling

- Modeled flood scenarios are chosen to reflect local conditions (bridge conditions, levees, temporary structures, etc.).
- In highly complex flow situations, a 2D model or unsteady flow model might be warranted.

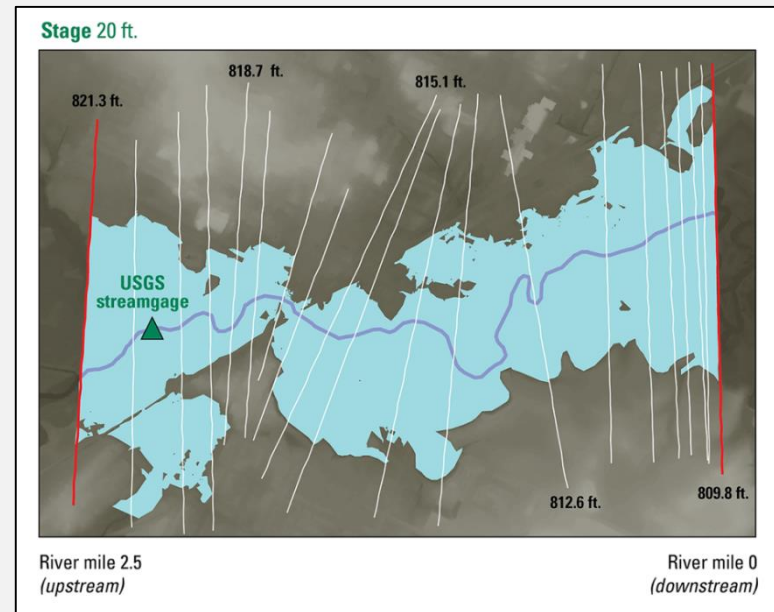

4. Delineate Flood Extents

Geospatial Processing

- Create TIN models using cross sections and the modeled water surface profile.
- Intersect the TIN with the DEM to generate predicted inundated areas depth grids.
- Clean up and QA data.
- Repeat for all modeled water surface profiles to generate a library of maps.

5. Compute Flood Depths

- Flood extents are processed with the topographic data to produce estimated depths across the floodplain.

6. Process Map Library

- The series of flood inundation maps are incorporated into the USGS Flood Inundation Mapper Website.
- Maps are overlaid onto city maps to aid in planning and response.
- Maps, data, and corresponding report must complete USGS review process prior to public dissemination.

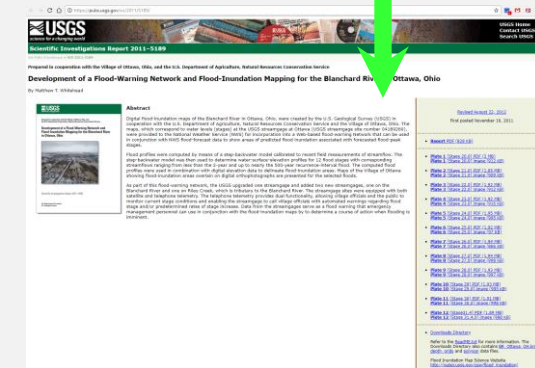

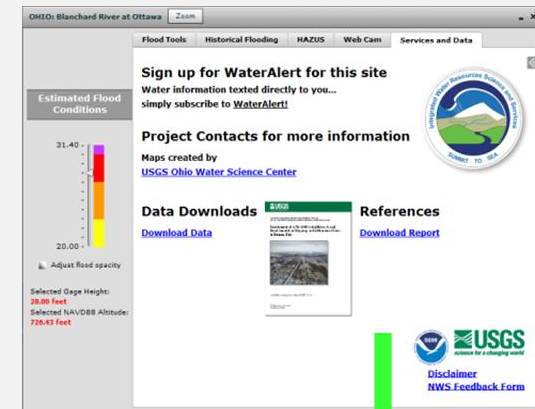

7. Publication

- Publicly available on the USGS Flood Inundation Mapper:

<https://wimcloud.usgs.gov/apps/FIM/FloodInundationMapper.html>

- Final Report
 - Study area and scope
 - Hydraulic model calibration and performance
 - Accuracy assessment
 - Uncertainty and use limitations
- Hydrologic data
- GIS FIM layers with metadata
- Hydraulic model

USGS FIM Mapper – more than just maps

Turns the modeled map data into an operational tool by combining data together with tools that enhance the utility and don't require any modeling or GIS software or skills.

Projecting changes in future rainfall extremes across Colorado due to a changing climate

Page Weil, PE
CASFM 2019

Motivating Question

How to put climate change adaptation tools
into the hands of real practitioners?

Intensity-Duration-Frequency (IDF) Curves

- NOAA Atlas-14 Archive; CONUS-wide database of rainfall intensities. Includes estimates at ungaged sites.
- Starting point for many H&H designs (MHFD)

Hydraulic Structure Design

- Design Frequency \approx Safety Margin
- H&H designs are often performed:
 - 1. Calculate discharge for storm of design intensity/duration/frequency
 - 2. Determine optimal culvert size
 - 3. Specify the use of the next largest size

Select DDFCD location for NOAA Atlas 14 Rainfall Depths from the pull-down list OR enter your own depths obtained from the NOAA website

1-hour rainfall depth, P1 (in) =	2-yr	5-yr	10-yr	25-yr	50-yr	100-yr	500-yr	
	0.83	1.09	1.33	1.69	1.99	2.31	3.14	Denver - Capitol Building
Rainfall Intensity Equation Coefficients =	a	b	c	$I(\text{in/hr}) = \frac{a * P_1}{(b + t_c)^c}$				Use Denver Area Intensity Equation Coefficients
	28.50	10.00	0.786					Q(cfs)

Time of Concentration			Rainfall Intensity, I (in/hr)							Peak Flow			
Inputed (min)	Regional t_c (min)	Selected t_c (min)	2-yr	5-yr	10-yr	25-yr	50-yr	100-yr	500-yr	2-yr	5-yr	10-yr	25-yr

MHFD H&H Design Tool for “Rational Method”

Table 7.2 Table of Design Frequencies

Drainage Type	Frequency
A. Cross Drainage	
Multilane Roads - including interstate	
In Urban Areas	100-year*
In Rural Areas	50-year
Two-Lane Roads	
In Urban Areas	100-year
In Rural Areas	
$Q_{50} \geq 4000$ cfs	50-year
$Q_{50} < 4000$ cfs	25-year
Culvert Outlet Scour Protection	10-year
Pedestrian Walkways and Bikeways	2 to 5-year
Bridge Foundation Scour	100 and 500-year
B. Parallel Drainage	
Roadway Overtopping and	
Revetment	Same as for Cross Drainage
Side Drains	2 to 10-year [#]
C. Storm Drains	
Major System	100-year
Minor System	2 to 5-year
D. Detour Culverts	monthly discharges for 2 to 5-year

Notes: *Urban cross culverts (not Interstate); if $Q_{100} < 100$ cfs, consider designing the culvert using the storm drain Minor System Frequency.
[#]Side drains shall not cause water to flow onto the highway at a greater probability than applies to cross drainage.

CDOT Drainage Design Manual, Chapter 7

CO Stations Studied

- 100-year 24-hour event depth (inches in 24 hours)
- Global Climate Model Grid

Climate Change Is Happening

Where We Are:

Global Average Temperature Change

Mean rainfall change is uncertain, peak rainfall is different

IPCC 2015, National Climate Assessment, 2018

Where We're Headed

Mean precipitation change at 1.5°C GMST warming

Mean precipitation change at 2.0°C GMST warming

Projected Change in Total Annual Precipitation
Falling in the Heaviest 1% of Events by Late 21st Century

Lower Scenario (RCP4.5)

Higher Scenario (RCP8.5)

Change (%)

Warmer Means Wetter

- For every 1°C increase in Temp, the atmosphere can hold 7% more water vapor
- Warmer Mean Temps mean...
 - ...the atmosphere can hold more water vapor
 - ...and more can fall as rain
 - ...extreme events will become more intense/frequent

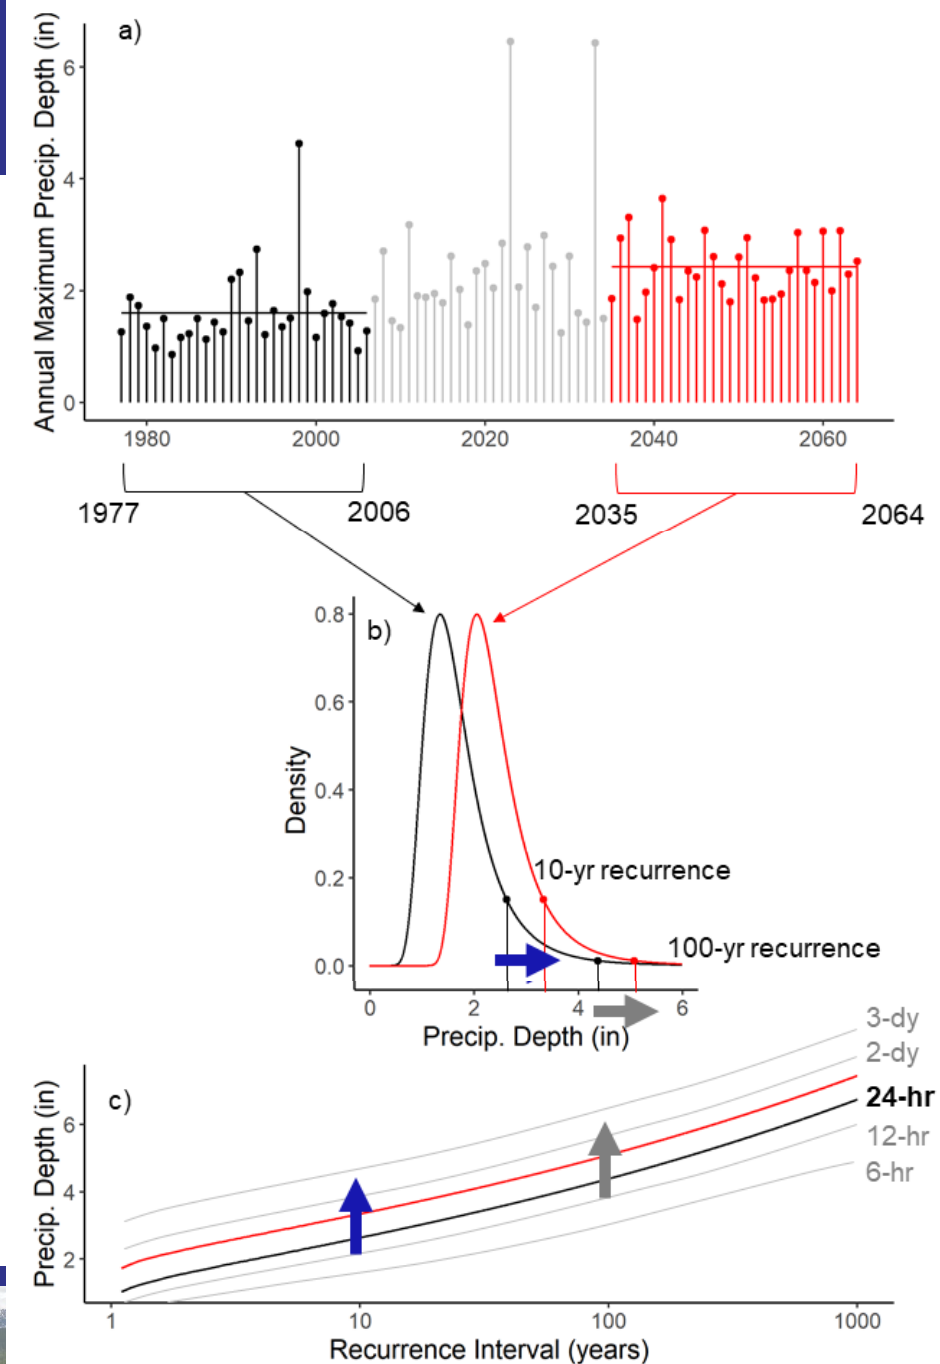

Figure 31: Actual Photo and Schematic of the Big Thompson Flash Flood Storm

Delta Method

- Extract Historic and Future Rainfall from GCM (24-hour event), ~3000 datapoints per grid cell
- Create historic and future distributions and extract relative change in event (ie, 100-year)
- Shift existing IDF curve by relative change

Change by Station (%)

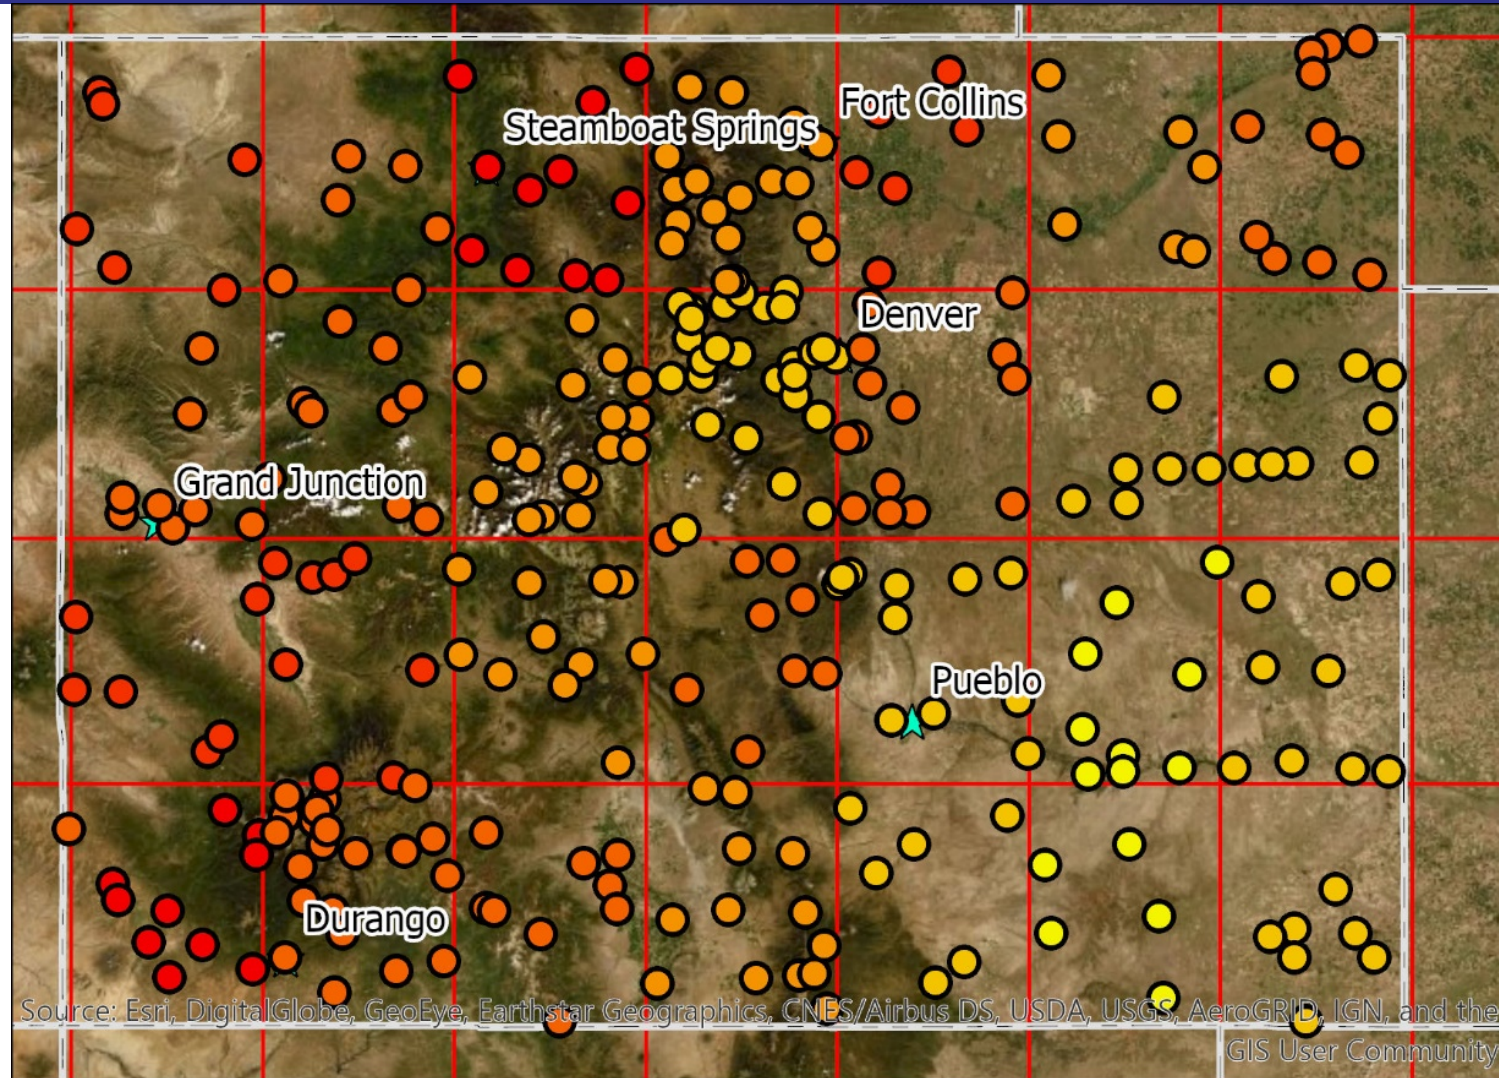

% Increase in 24-hour...

...100-year event

...at 2°C warming

Jumps at grid edges
due to 1-degree
cells.

Assessing other
downscaling projects

GCM Grid

 GCM Grid

% Increase
in 100-Yr
Depth

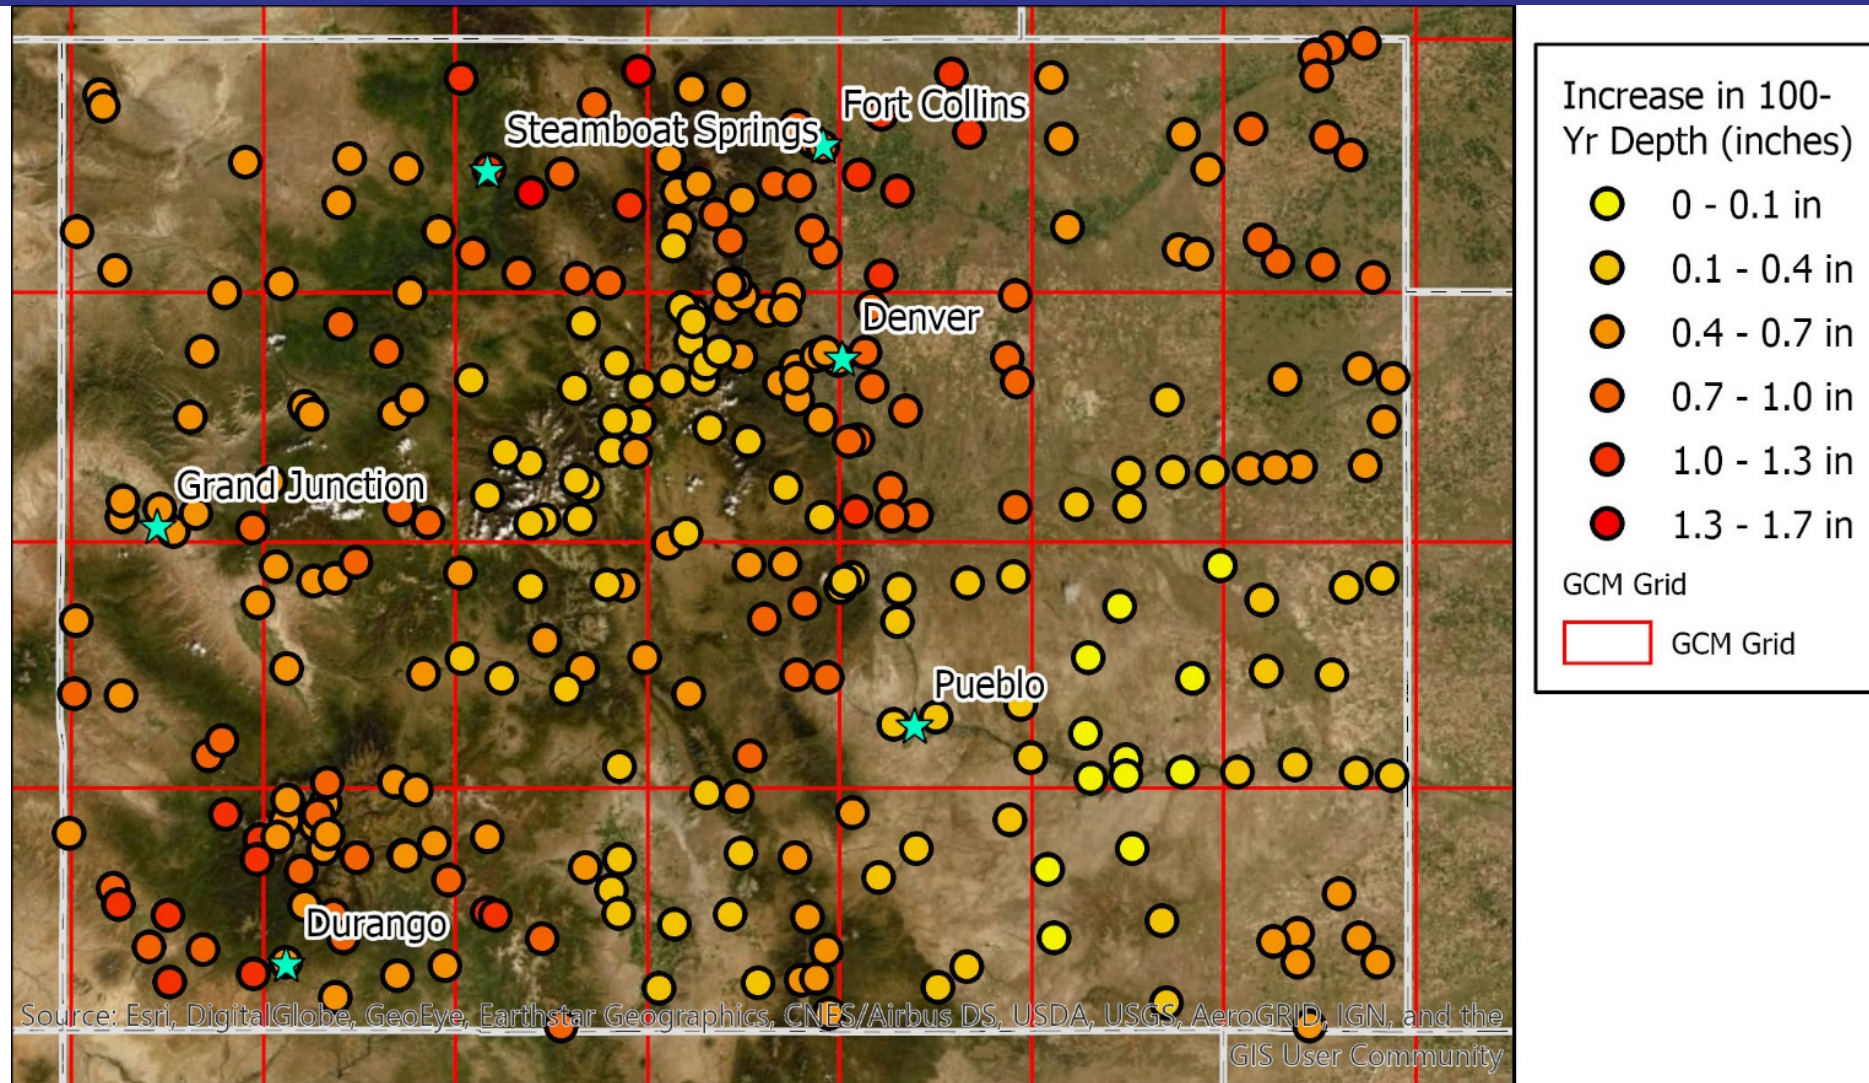

Change by Station (inches)

Additional inches of rain...

...during 24-hour

...100-year event

...at 2°C warming

Point Results

Stapleton Station

Climate change will shift estimates and error bounds.

Method extends to all event durations
(5 min to 60 days)

Change in Extreme Rainfall by Scenario

- We use future global average temperature, not a future time period.
- Warmer models show larger increase aligned with 7% per degree warming

Implications of Frequency Shift

- Frequency-Based designs may be underestimating peak discharge
 - Critical facilities may be exposed to higher risk than expected
- New Designs can Incorporate Climate Adjustments in Frequency

Boulder Creek Normal Flow (<1-year event)

Boulder Creek, Sep 2013, 40-Year Flow Event

So What Do We Do?

Mitigation and Limiting Emissions are important but the earth is a big ship with a small rudder

Adaptation and Resiliency are how we move forward protecting our communities while the world wrestles with CO2 emissions.

Statewide Action: As of 2019, CWCB has recommended a 7% safety factor to be applied to PMP estimates for Dam Safety based on a “1-degree warmer world”.

How Can Designers Use This?

Local Mandate:

- Municipalities need to decide that climate change adaptation is a priority for their community.
- What facilities should include climate change adjustments in their design?

Local Action:

- Identify “No Regrets” actions (New Designs)
- Design decision by H&H engineers backed up by planning mandate.

Apply best available data:

- **IDF Curves:** NOAA Atlas 14, MHFD, others
- Projected event changes from CWCB project

Gridded Results Browser

ArcGIS StoryMap with
relative increases in
100-year, 24-hour
events

CWCB next steps
project

<https://arcg.is/1KaW5S>

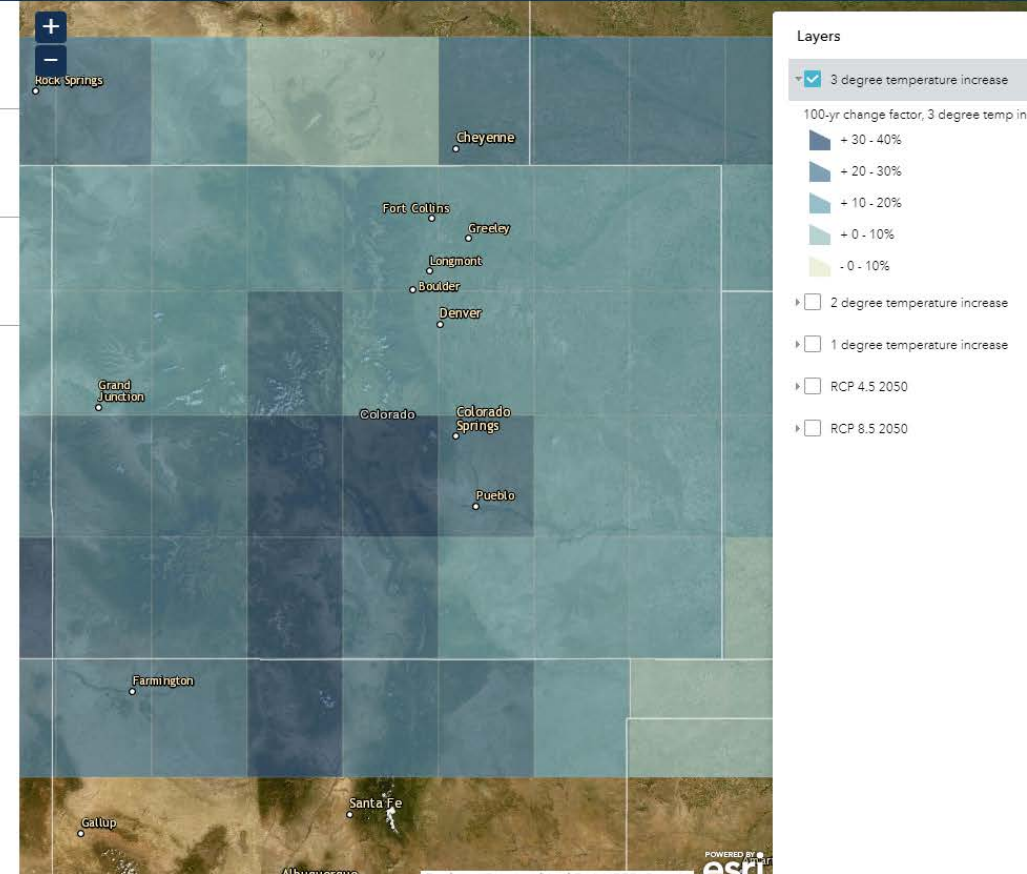

CWCB IDF Project

- 1 Available Station Data
- 2 Annual Maximum Regressions
- 3 NOAA Atlas 14 IDF Data
- 4 IDF Non-stationarity

The colored tiles in the map to the right depict the % change between historical and future 100-yr 24-hr precipitation events, as inferred by Global Climate Model (GCM) ensemble output. These results were generated by analyzing precipitation output from an ensemble of GCMs. Specifically, we derived two Generalized Extreme Value distributions (GEVs), from historical and future simulated daily annual maximum precipitation values. Historical and future 100-year 24-hour precipitation events were extracted from the GEVs and the percent change between historical and future was quantified.

In order to assess changes in extreme precipitation, we extracted and compared data from historical and future periods. The historical period was defined as a 30-year window, extending from 1977 – 2006. The future period was defined by two different approaches. The first approach simply defined the future period as a 30-year window, centered around year 2050. We considered two emission scenarios for the future period, RCP 4.5 and RCP 8.5. The second approach defined the future period as a 30-year window centered around the year in which simulated global average temperatures reach specific temperature change thresholds (1, 2, and 3 degrees Centigrade), relative to preindustrial conditions.

Toggle layers on and off to see how the 100-yr 24-hour precipitation event changes under various future scenarios.

Questions for you

Is your local government considering climate change adaptation?

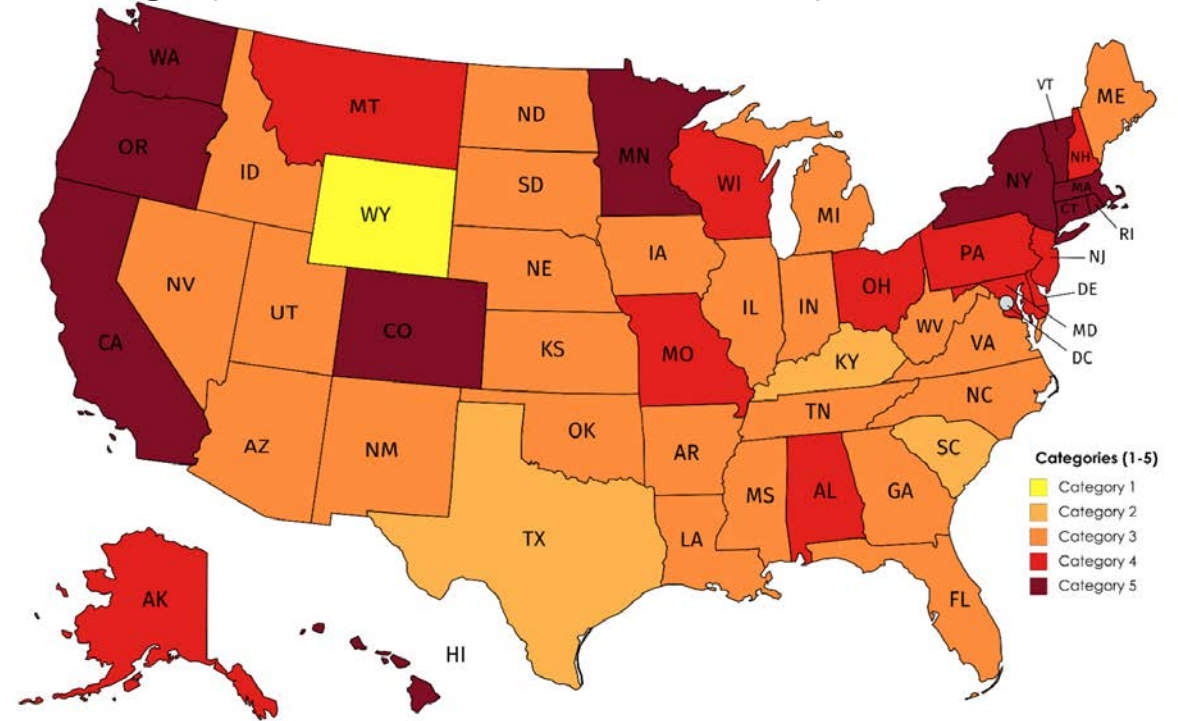

What tools do you need to present climate change risks in a way that is ~~politically sensitive~~ can reach your community?

Questions for me?

Page Weil, PE

pweil@lynkertech.com

State Hazard Mitigation Plans that Include Climate Change (Columbia Law School, 2019)

Category 4 - Thorough discussion of climate change impacts on hazards with more inclusion of quantitative info. 18 States have this or better

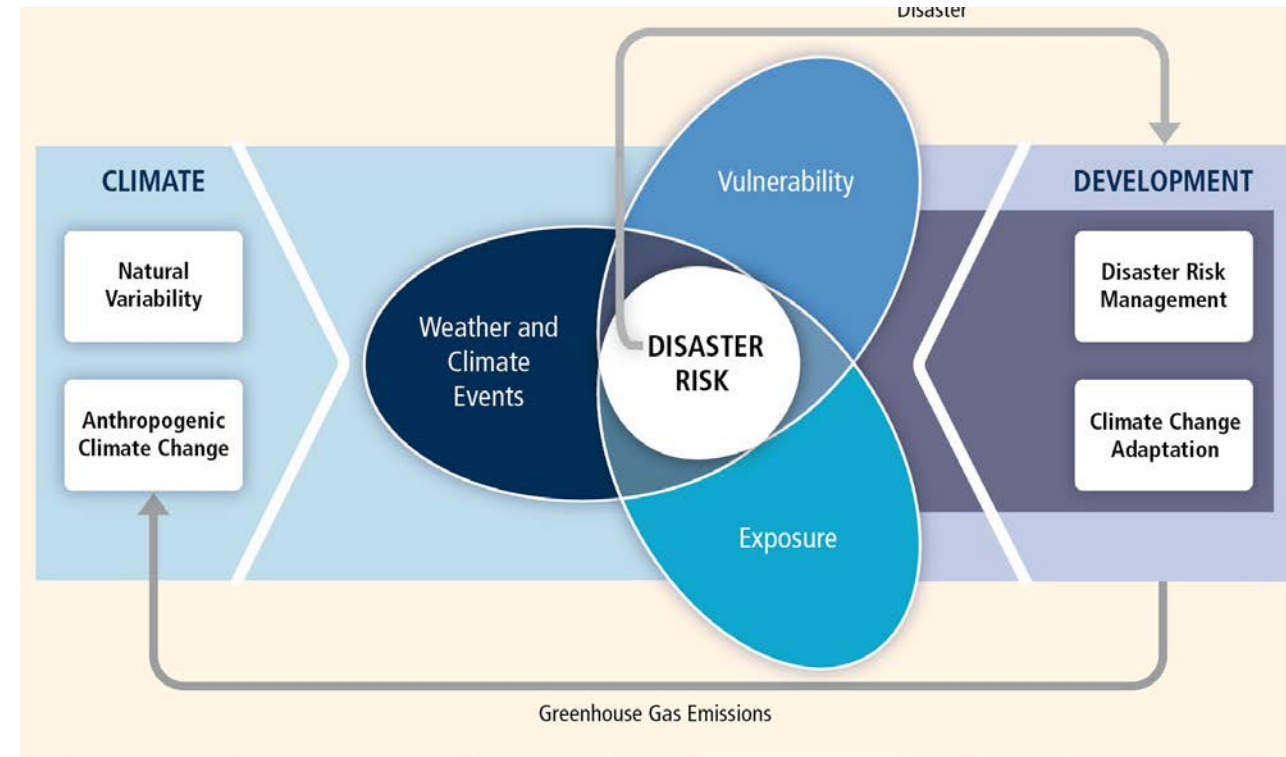

Extra Slides

Motivation

- Risk
 - Hazard
 - Vulnerability
- Media coverage on Climate Change is inconsistent and the messages are muddled
- What are some design criteria CO can consider when adapting to climate change?

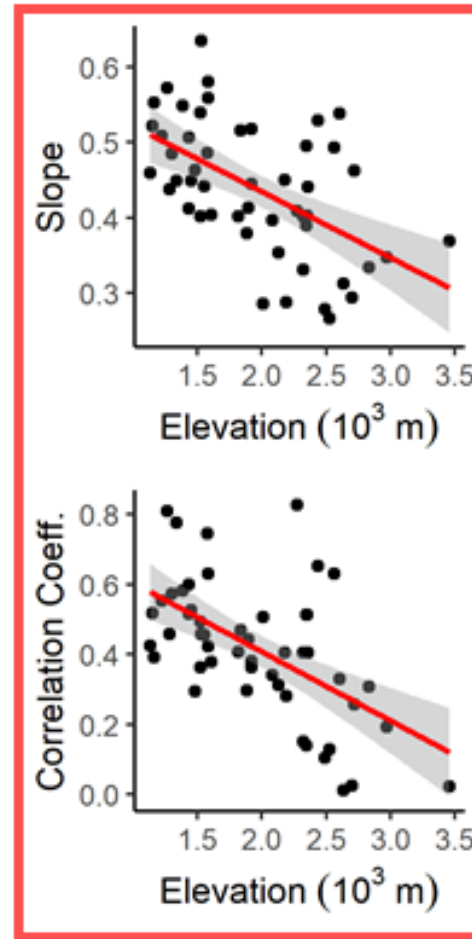

IPCC SREX Report

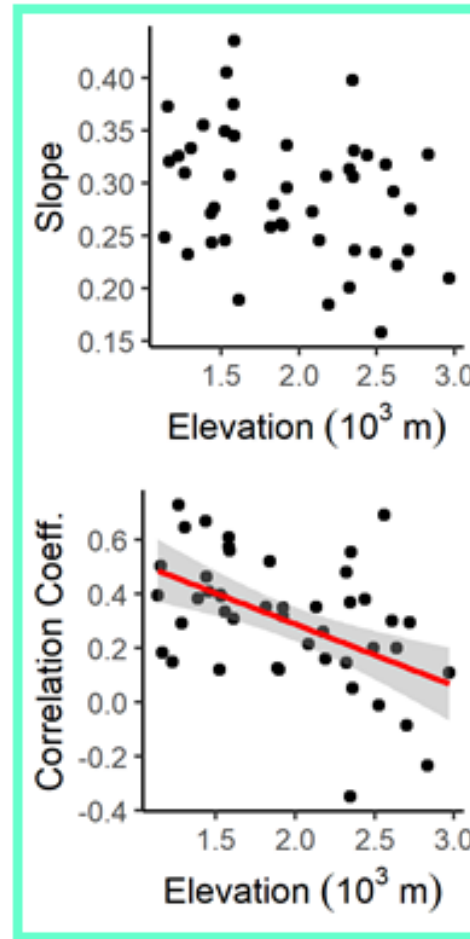

Extend to Shorter Durations

- Relationship between hourly and daily storm intensity varies with elevation.
- Allows us to extend projections to more IDF curve products

Hourly = $f(\text{Daily})$

15-minute = $f(\text{Daily})$

Basics of Global Climate Models

Source: Climate.gov

Planning Horizon

- CO Water Plan uses 2050 as the representative planning horizon
- Benefits of using temperatures instead of years for planning
- Paris Accord has targets at 1.5 and 2°C (relative to pre-industrial conditions)
 - We are already at 0.75°C

Wobus et al 2018

Warmer Means More Intense Rainfall

- Warmer Mean Temps mean...
 - ...the atmosphere can hold more water vapor
 - ...and more can fall as rain
 - ...extreme events will become more intense/frequent
- Clausius-Clapeyron Scaling
 - 7% increase in water vapor per degree of temp increase.

Kunkel, K., & Easterling, D. R. (2017). An Approach Toward Incorporation of Global Warming Effects Into Intensity-Duration-Frequency Values, H22B-04, presented at 2017 AGU Fall Meeting, New Orleans, LA, 11-15 Dec 2017. New Orleans, LA.

What Can We Do About It?

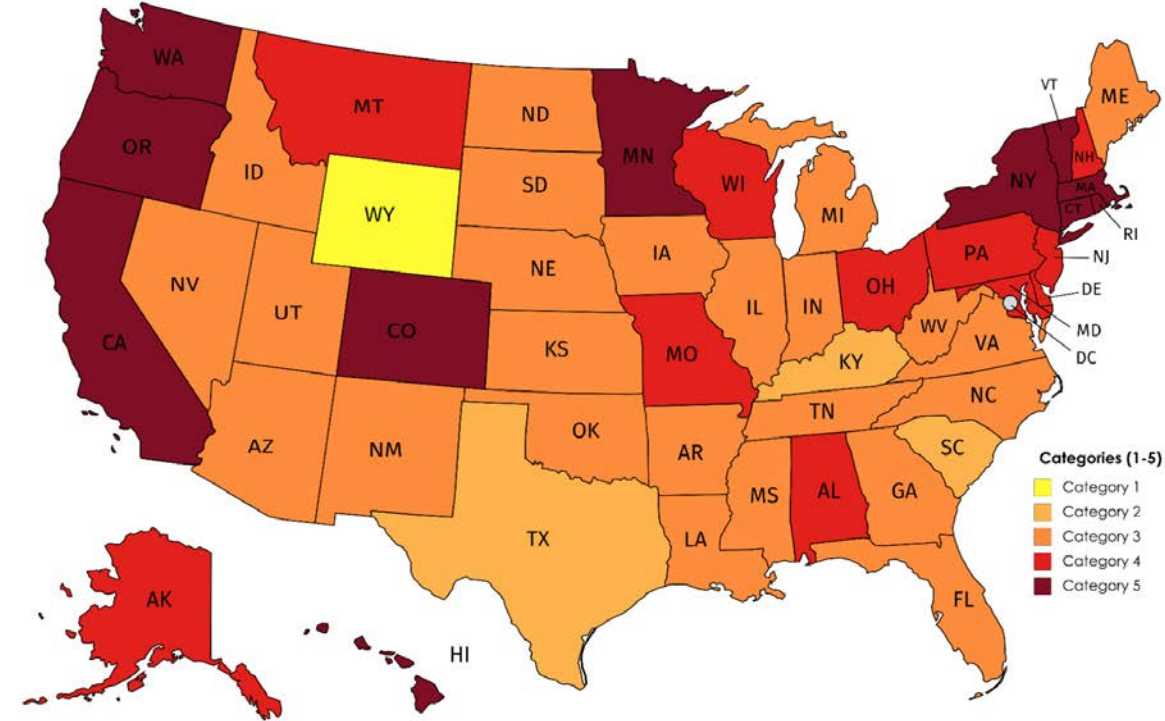

Mitigation is important but we're a big ship with a small rudder.

Local Action: Climate-Adjusted IDF curves can be used by any H&H designer

Local Mandate: Municipalities need to decide that climate change I take their own action on climate resilience.

Statewide Action: As of 2019, CWCB has recommended a 7% safety factor to be applied to PMP estimates for Dam Safety based on a "1-degree warmer world".

State Hazard Mitigation Plans & Climate Change; 2019 Update, Columbia Law School

Category 3- Significant discussion of climate change but typically more qualitative in nature. 32 States have this or less.

Using ArcGIS Pro and ArcGIS Online for Hydraulic Field Applications and Stakeholder Outreach

Anthony Alvarado, PE, CFM

Brian Varrella, PE, CFM

Brianna Corsi, EI

CASFM Conference

Crested Butte, Colorado

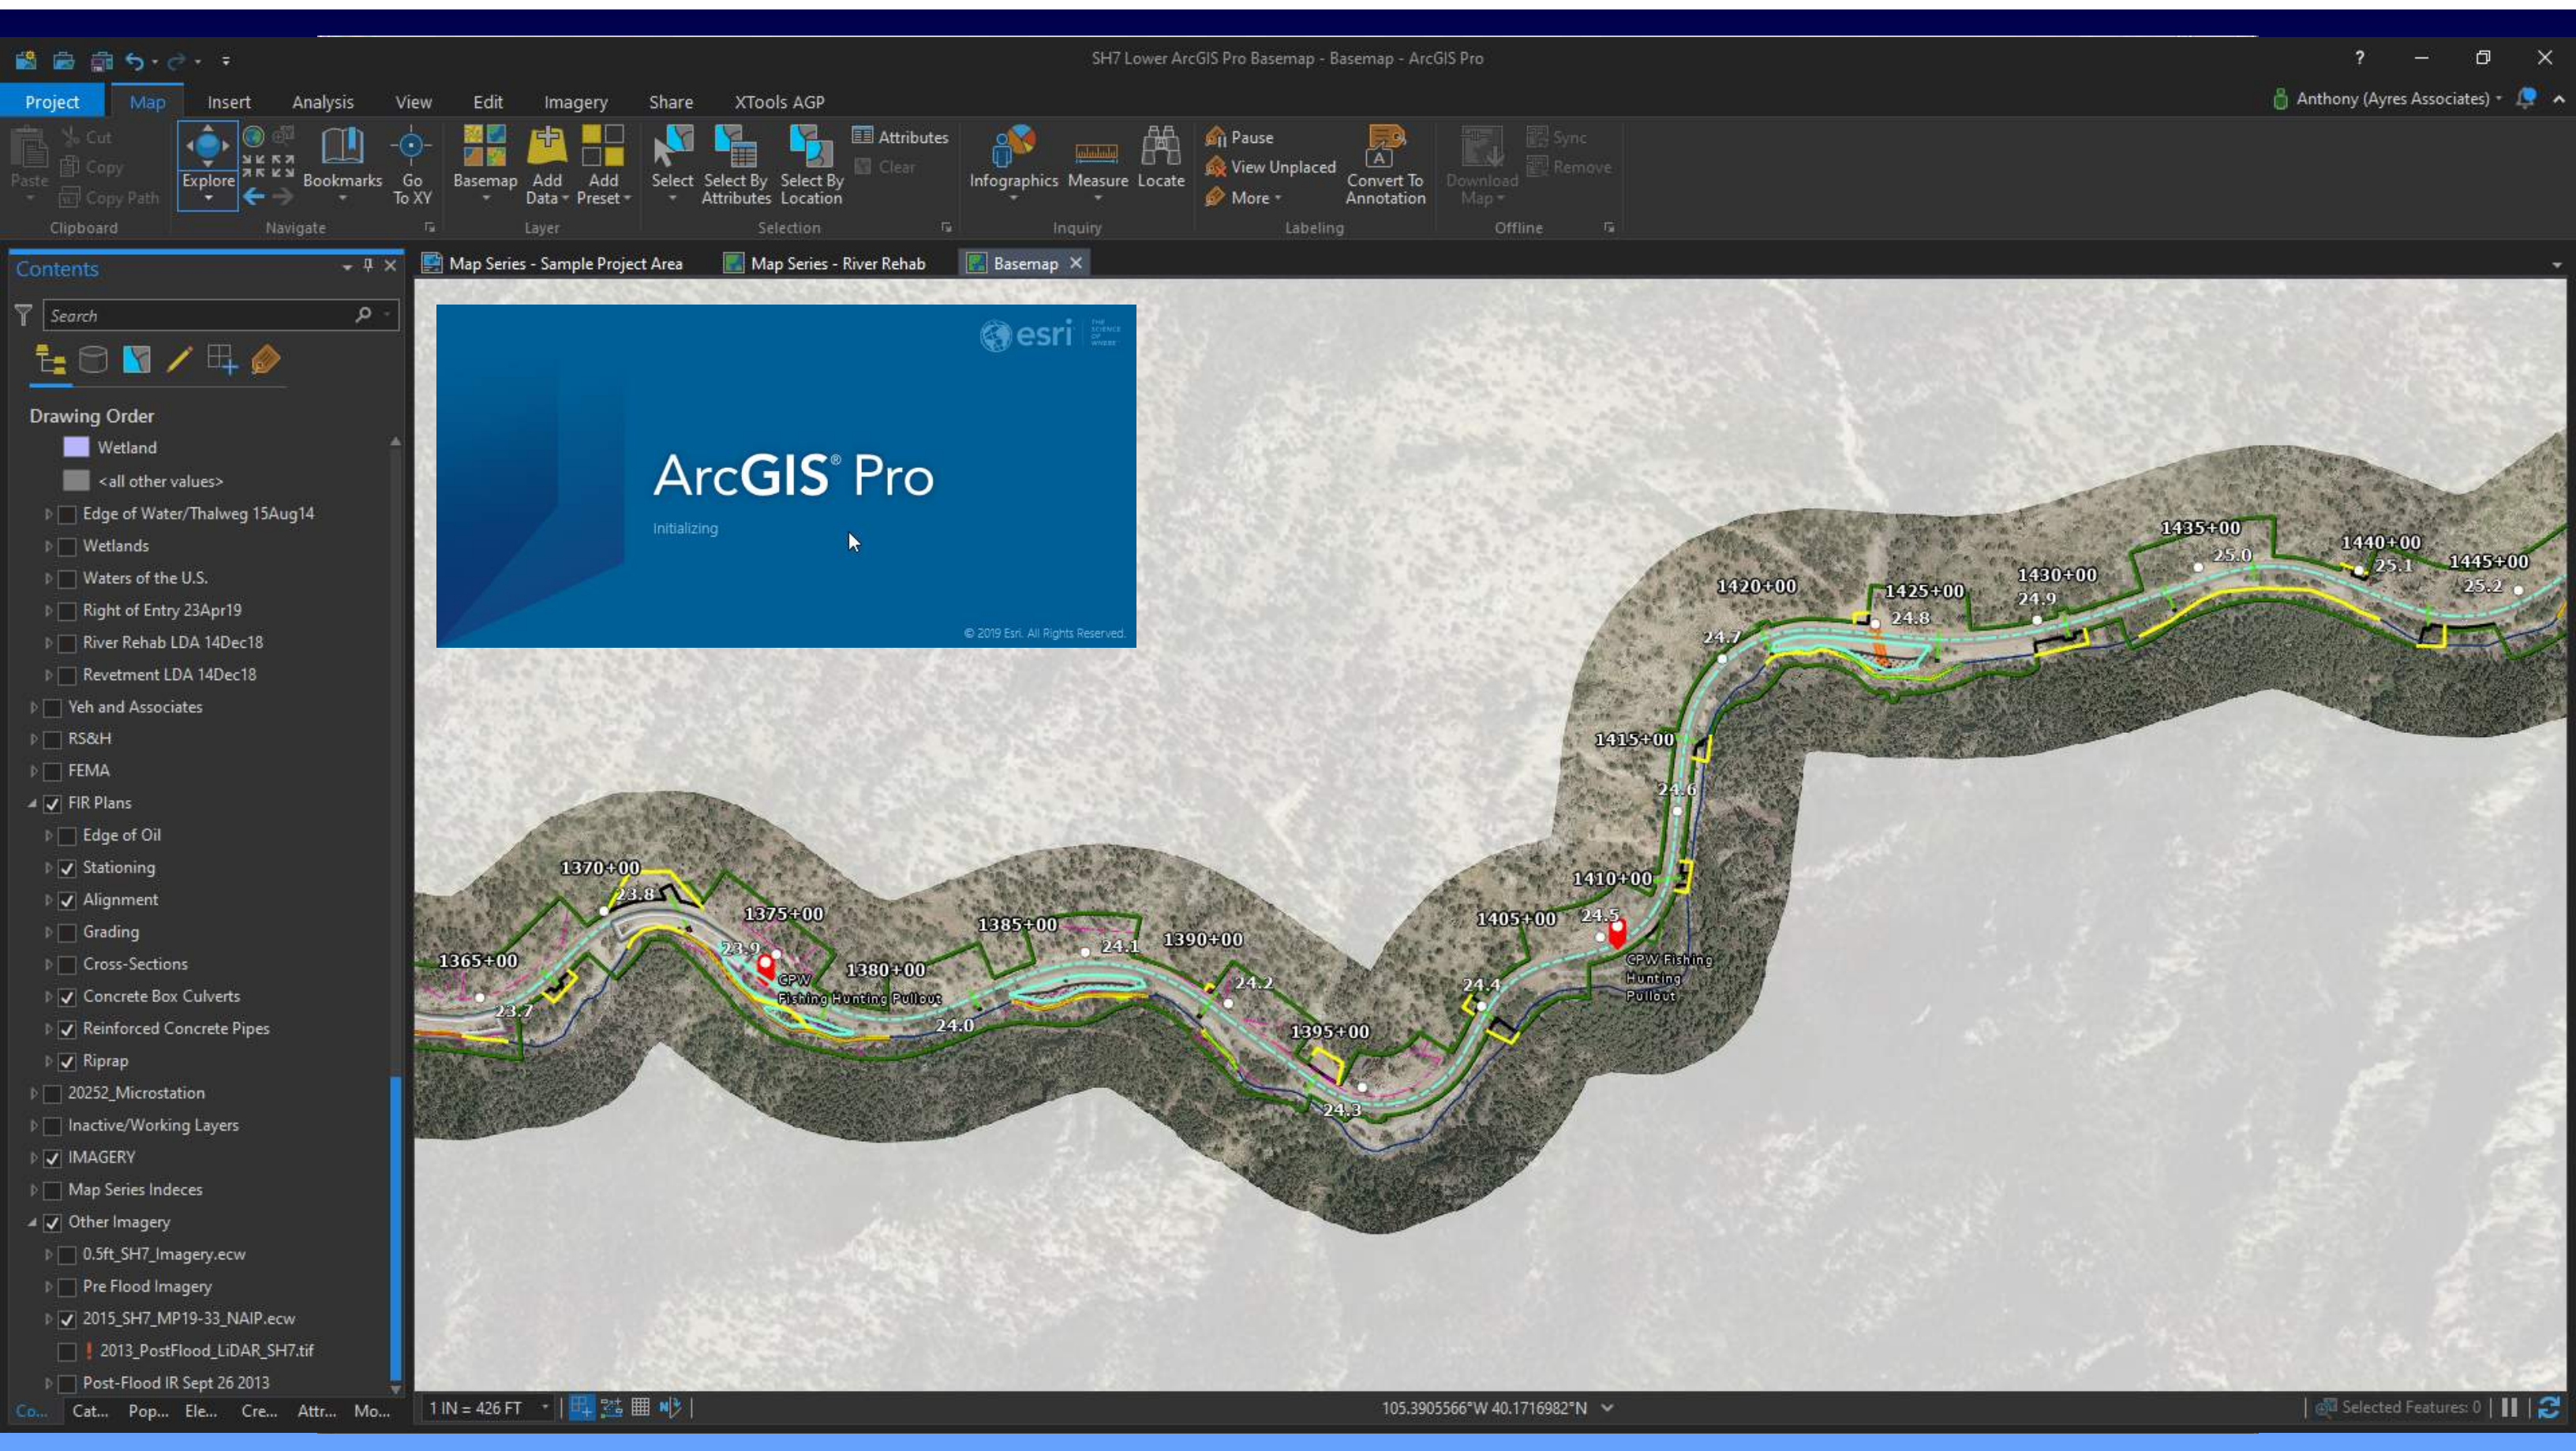

September 2019

Overview

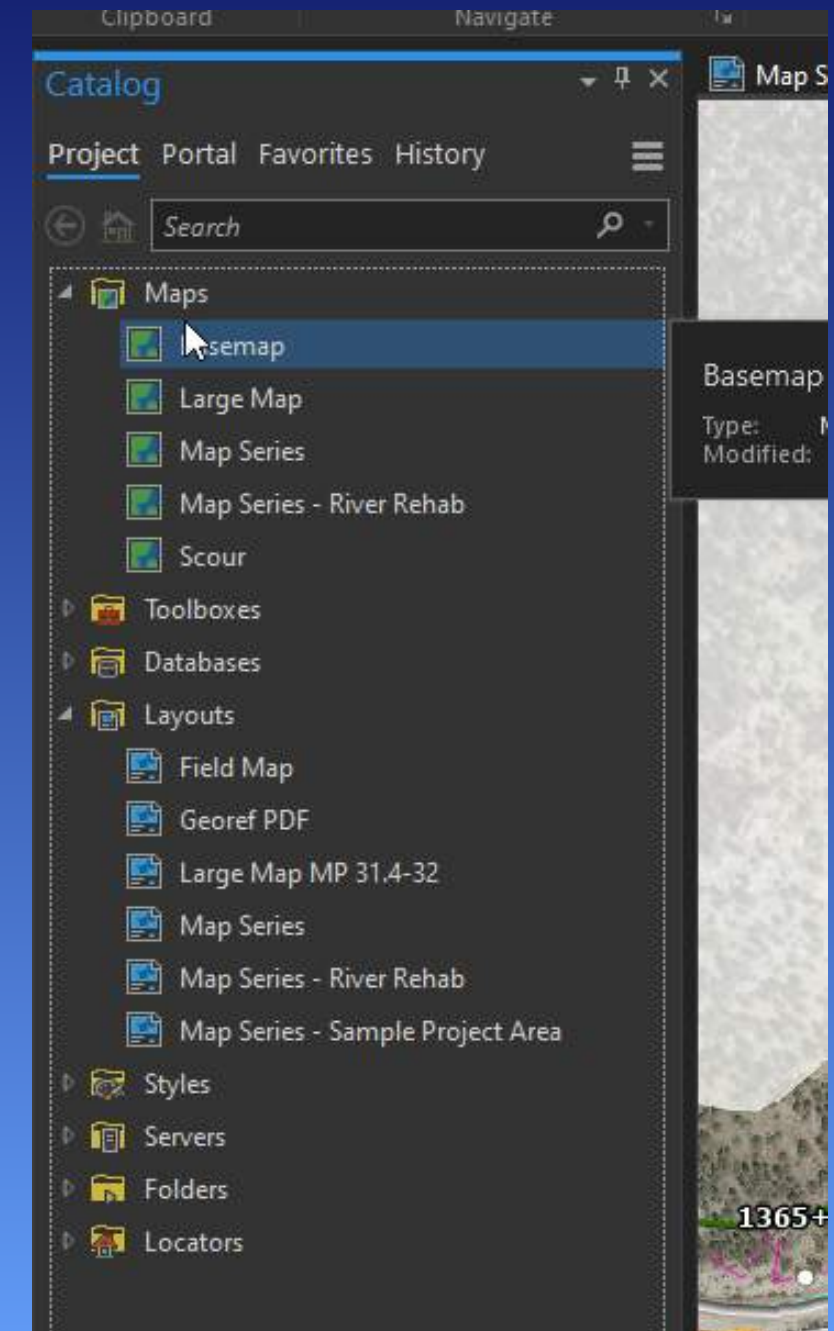

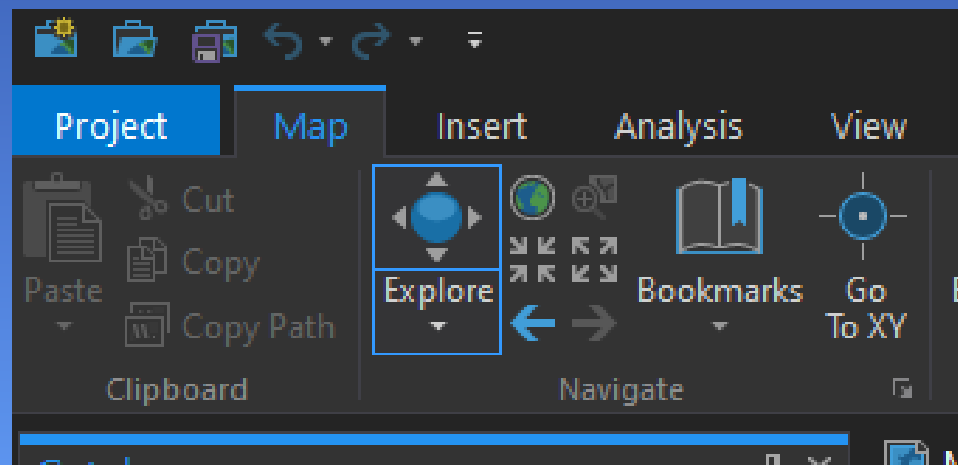

- **ArcMap to ArcGIS Pro**
 - You need to go pro!
- **Field Data Collection Tools**
 - CDOT C-Plan with Collector/Survey123
- **Utilizing ArcGIS Online**
 - From paper/PDFs to a live map
 - Benefits and Limitations

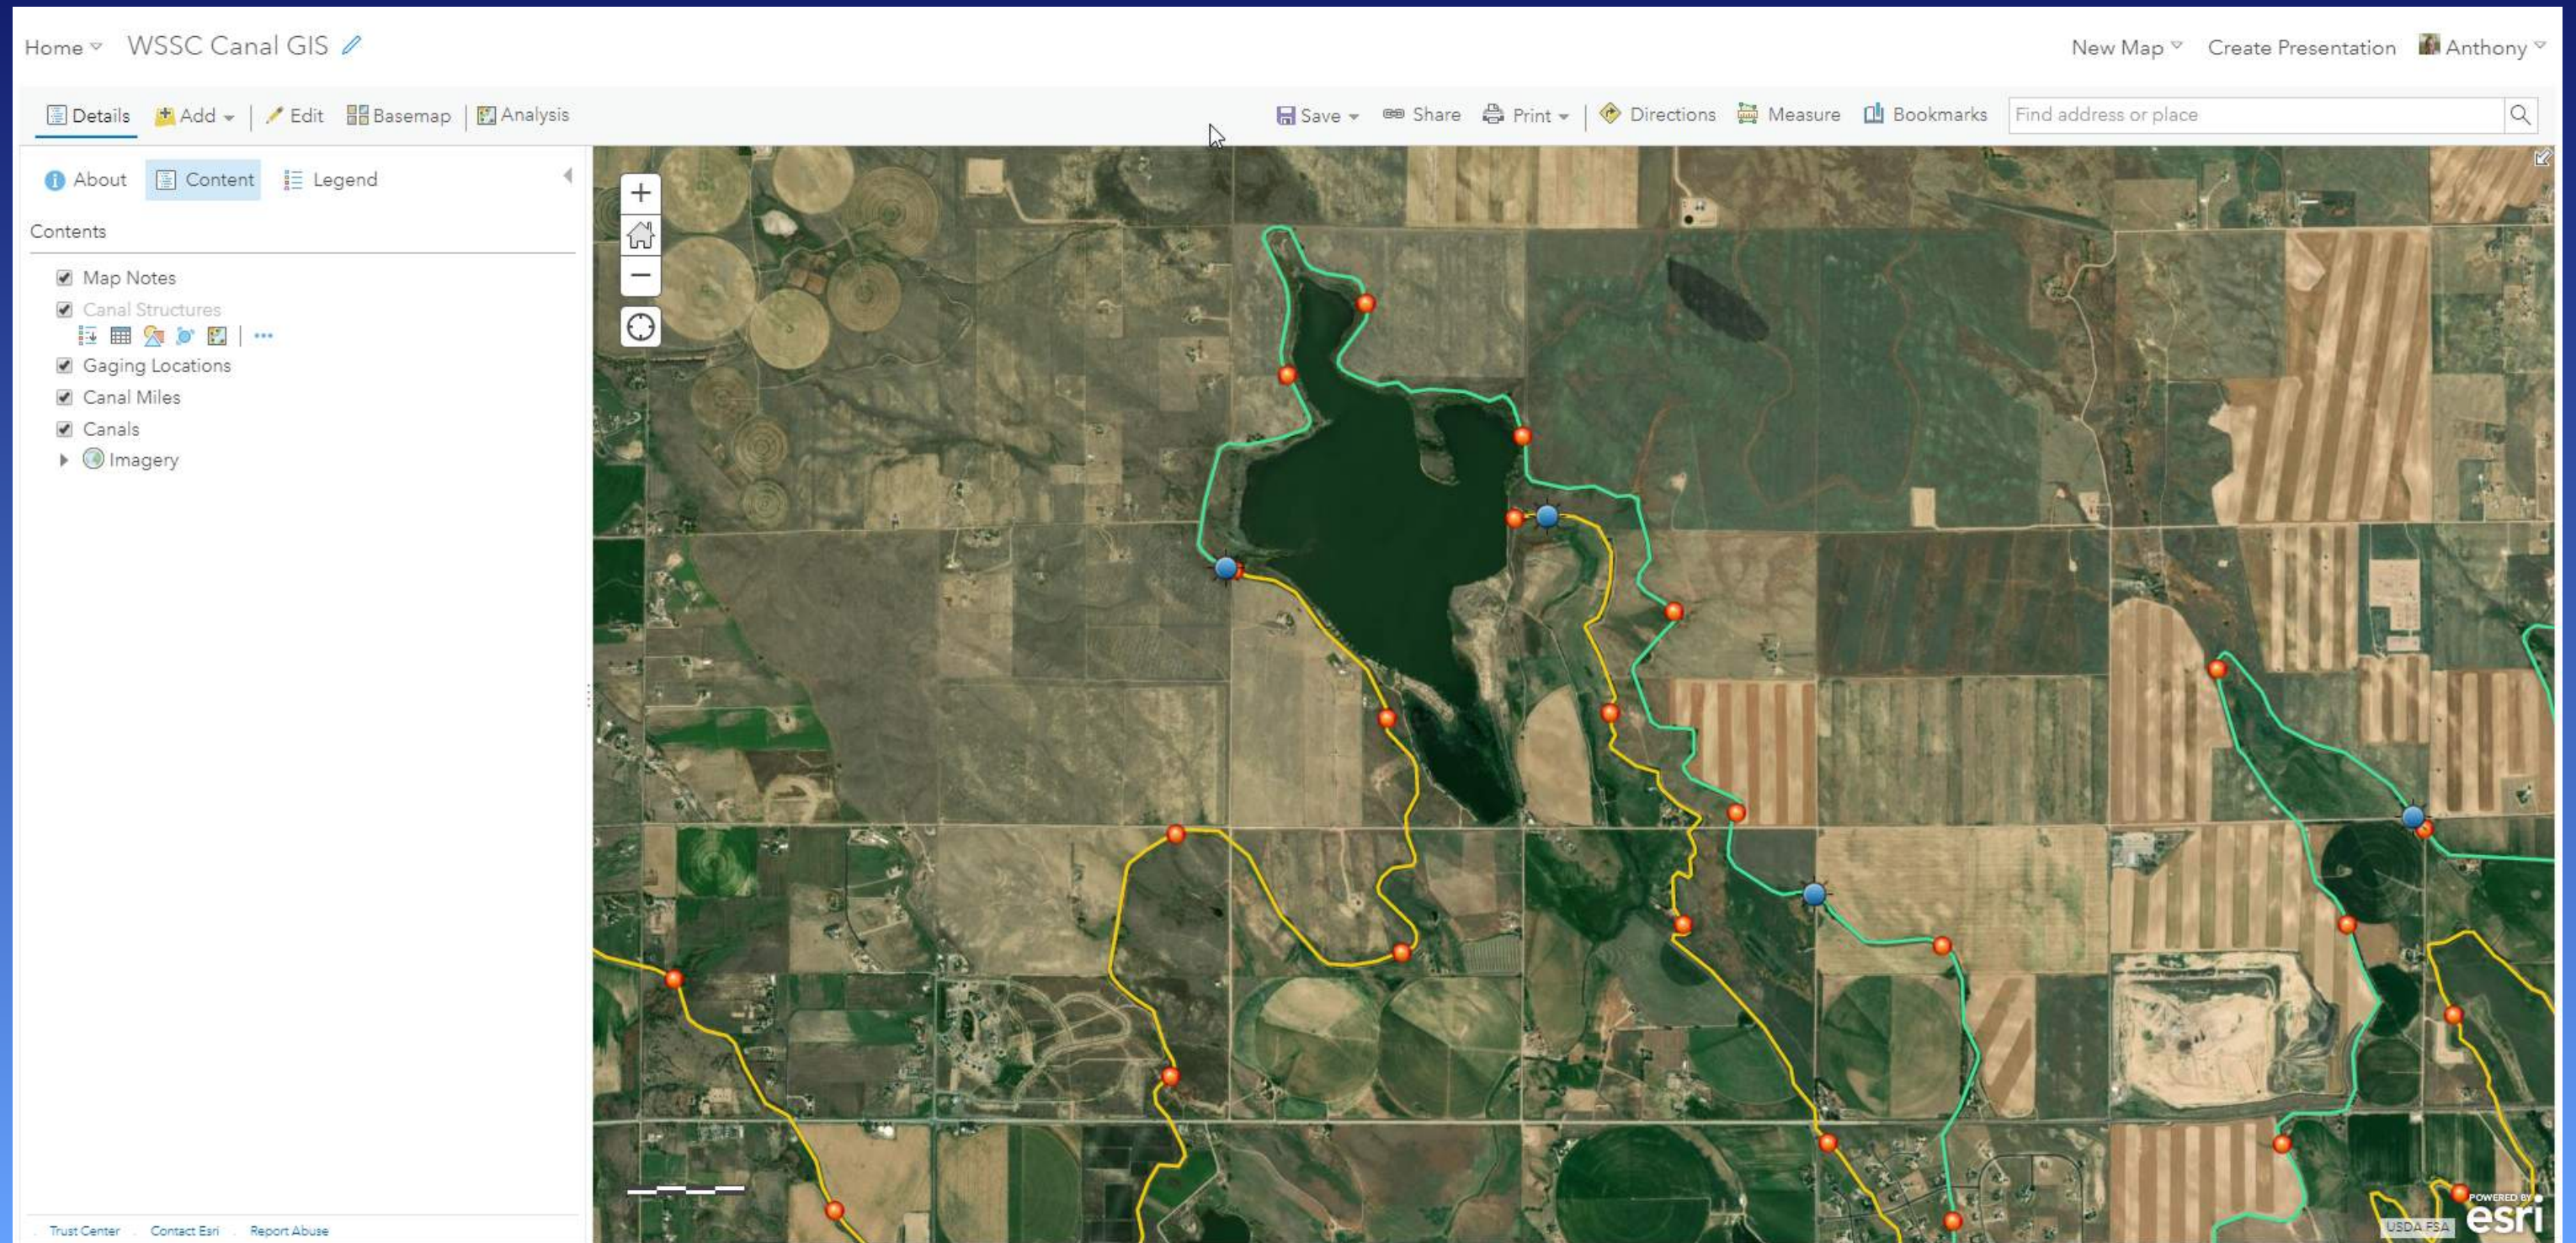

Benefits of Going Pro

- 64-bit Processing = SPEED
- Ribbon interface = MORE INTUITIVE
- Project-based = MULTIPLE LAYOUTS
- Easier feature editing
- Better integration with ArcGIS Online

What is ArcGIS Online?

What is ArcGIS Online?

The screenshot shows the ArcGIS Online interface. At the top, there's a navigation bar with links: Home, Gallery, Map, Scene, Groups, Content (selected), and Organization. To the right of the navigation bar are search, notifications, and user profile (Anthony Alvarado, alvaradoa). Below the navigation bar is a sub-navigation bar with links: Content (selected), My Content, My Favorites, My Groups, My Organization, and Living Atlas. Below the sub-navigation bar is a toolbar with buttons: Add Item, Create, Search alvaradoa, Table, Date Modified, and Filter. The main content area is divided into two columns. The left column contains a Folders sidebar with a search bar, a list of folders (All My Content, alvaradoa), and a Filters section with Categories and Item Type. The right column displays a list of items, showing 1 - 16 of 16 in alvaradoa. The items are listed in a table with columns: Title, Type, and Modified. The items include CDOT 20252 SH7 Lower Basemap, SH7 Lower Base Map, field_waypoints, field_waypoints, Monte_CDOT_Waypoints, Monte_CDOT_Waypoints, Damaged_Areas_lines, Damaged_Areas_lines, FS_Restoration_Areas, FS_Restoration_Areas, Mile_Points, Mile_Points, RG_RM_205_8_Geomorphic_Analysis, and WSSC Canal GIS.

Field Data Collection – Avenza Maps

SH7 Lower ArcGIS Online Map

SH7 Lower ArcGIS Online Map

DEMONSTRATION

ArcGIS Online Map – Benefits

- Only need basic proficiency in ArcGIS
 - No need for a GIS Server
- Easy to turn on and off
- Less paper, even with iteration
- Easier for stakeholders to use
- Immediate updates – *live nesting!*
 - No waiting for next map revision!

ArcGIS Online Map – Limitations

- Might still need paper maps for the field for stakeholders
 - Offline access to Collector needs a GIS server
- Cannot group layers
- Cannot utilize raster layers
- Does not support complex symbolization

ArcGIS Online Map – Basic Tips

- Export shapefiles to ArcGIS Online using Pro
- Add to online map and check layer styles
- Each feature then needs to be shared individually publicly to then share the full map
- Set your permissions correctly within your organization

Summary

- **ArcGIS Pro is a significant upgrade over ArcMap**
- **Direction of GIS is improving field data collection**
- **ArcGIS Online can feasibly replace paper maps as a communication tool**
